## 0. Introduction

Let  $k$  be an algebraically closed field of characteristic 0 and  $P = \mathbb{P}_k^3$  the 3-dimensional projective space over  $k$ . The natural question of determining the triples of integers  $(c_1, c_2, c_3)$  which can be the Chern classes of a stable rank 3 vector bundle on  $P$  was formulated by R. Hartshorne in [6, Problem 14]. Since then, a number of results have been obtained which have limited the possible values of these triples. First of all, the Theorem of Riemann-Roch implies that  $c_1 c_2 \equiv c_3 \pmod{2}$ . Then, for each  $c_1, c_2$ , there are bounds on  $c_3$  which have been obtained by G. Elencwajg, O. Forster, M. Schneider and H. Spindler. Their results are summarized in [3]. We can normalize any rank 3 vector bundle on  $P$  by a suitable twist such that  $c_1 = 0, -1$  or  $-2$ . Furthermore, by dualizing the bundle (and twisting with  $-1$  if  $c_1 = -1$  or  $-2$ ) we may suppose that  $c_3 \geq 0$  if  $c_1 = 0$ ,  $c_3 \geq -c_2$  if  $c_1 = -1$  and  $c_3 \geq 0$  if  $c_1 = -2$ . Now, according to [3, Sect. 4] one has:

- (i) If  $c_1 = 0$  then  $c_2 \geq 2$  and  $c_3 \leq c_2^2 - c_2$
- (ii) If  $c_1 = -1$  then  $c_2 \geq 1$  and  $c_3 \leq c_2^2 - 2c_2 + 2$
- (iii) If  $c_1 = -2$  then  $c_2 \geq 2$  and  $c_3 \leq c_2^2 - 3c_2 + 2$

Furthermore, L. Ein, R. Hartshorne and H. Vogel have proved in [3, (7.4.1)] that one cannot have  $c_1 = 0$ ,  $c_2 \geq 5$  and  $c_2^2 - 3c_2 + 6 < c_3 < c_2^2 - c_2$

Using [2] one finds further restrictions to be imposed to

the Chern classes of a stable rank 3 vector bundle on P. Before stating these restrictions we introduce some notations. Put:

$$M_0(1, c_2) = \{c_2^2 - c_2\}$$

$$M_0(q, c_2) = [c_2^2 - (2q-1)c_2, c_2^2 - (2q-1)c_2 + 2(q^2 - q + 1)] \setminus$$

$$\bigcup_{d=1}^{d_0(q)} (c_2^2 - (2q-1)c_2 + 2(d-1)q, c_2^2 - (2q-1)c_2 + 2dq - 2d(d+1)), \text{ for } q \geq 2$$

$$M_1(q, c_2) = [c_2^2 - 2qc_2, c_2^2 - 2qc_2 + 2q^2] \setminus$$

$$\bigcup_{d=1}^{d_1(q)} (c_2^2 - 2qc_2 + 2(d-1)q + 2(d-1), c_2^2 - 2qc_2 + 2dq - 2d(d+1)), \text{ for } q \geq 1$$

$$M_2(q, c_2) = [c_2^2 - (2q+1)c_2 + 2q, c_2^2 - (2q+1)c_2 + 2q^2] \setminus$$

$$\bigcup_{d=1}^{d_2(q)} (c_2^2 - (2q+1)c_2 + 2dq, c_2^2 - (2q+1)c_2 + 2(d+1)q - 2d(d+2)), \text{ for } q \geq 1$$

where  $d_0(q)$  is the largest integer for which  $d(d+1) < q-1$ ,  $d_1(q)$  is the largest integer for which  $(d+1)^2 \leq q$  and  $d_2(q)$  is the largest integer for which  $(d+1)^2 < q$ . It is easy to see that if  $d(d+1) < q-1$  or if  $(d+1)^2 \leq q$  then  $2dq - 2d(d+1) \leq \frac{1}{2} \cdot (q^2 - 2q)$ , and if  $(d+1)^2 < q$  then  $2(d+1)q - 2d(d+2) \leq \frac{1}{2} \cdot (q^2 + 3)$ . Now, according to [2, (2.7), (2.8) and (2.9)] one has:

$$(0) \text{ If } c_1 = 0 \text{ then } c_2 \geq 2 \text{ and } c_3 \leq \frac{1}{2} \cdot c_2^2 \text{ or } c_3 \in M_0(q, c_2) \text{ for some } 1 \leq q \leq \frac{1}{2} \cdot (c_2 + 1)$$

$$(1) \text{ If } c_1 = -1 \text{ then } c_2 \geq 1 \text{ and } c_3 \leq \frac{1}{2} \cdot c_2^2 \text{ or } c_3 \in M_1(q, c_2) \text{ for some } 1 \leq q \leq \frac{1}{2} \cdot (c_2 - 1)$$

$$(2) \text{ If } c_1 = -2 \text{ then } c_2 \geq 2 \text{ and } c_3 \leq \frac{1}{2} \cdot (c_2 - 1)^2 \text{ or } c_3 \in M_2(q, c_2) \text{ for some } 1 \leq q < \frac{1}{2} \cdot (c_2 - 1).$$

The aim of the present paper is to show that the above conditions suffice to assure the existence of a stable rank 3 vector bundle on P with the given Chern classes. We prove this assertion by producing various examples of stable rank 3 vector bundles.

With some exceptions, these bundles are realized as extensions:

$$0 \longrightarrow \mathcal{F} \longrightarrow E \longrightarrow I_{Y \cup S} \longrightarrow 0$$

where  $\mathcal{F}$  is one of the stable rank 2 reflexive sheaves constructed by R. Miró in [7],  $S$  is the singular scheme of  $\mathcal{F}$  and  $Y$  is a plane curve or the empty scheme. This kind of extension is described in [1, Sect.3].

Hence, we prove the following:

Theorem.  $c_1, c_2, c_3$  can be the Chern classes of a stable rank 3 vector bundle on  $P$  if and only if  $c_1 c_2 \equiv c_3 \pmod{2}$  and, after normalizations,  $c_1, c_2, c_3$  satisfy one of the conditions (0), (1), (2).

I take this opportunity to express my thanks to C. Bănică for his consistent help and encouragement.

#### 1. Complements about Extensions and Some Useful Examples

Let  $\mathcal{F}$  be a rank 2 reflexive sheaf on  $P$  which can be realized as an extension.:

$$0 \longrightarrow \mathcal{O}_P(a) \longrightarrow \mathcal{F} \longrightarrow I_Z(b) \longrightarrow 0 \quad (1)$$

where  $Z$  is a closed subscheme of  $P$ , locally complete intersection (l.c.i.) of codimension 2. The extension is determined by a global section  $\xi$  of  $\omega_Z(4+a-b)$  which generates this sheaf except at finitely many points. It follows, using the exact sequence (1), that  $\text{Ext}^1(\mathcal{F}, \mathcal{O}_P) \cong \omega_Z(4-b)/\mathcal{O}_Z(-a) \cdot \xi$ , hence there is a 0-dimensional closed subscheme  $S$  of  $P$  such that  $\text{Ext}^1(\mathcal{F}, \mathcal{O}_P) \cong \mathcal{O}_S$ . Let  $Y$  be a l.c.i. closed subscheme of  $P$  of codimension 2 such that  $Y \cap S = \emptyset$ . Let  $t$  be an integer. Suppose that  $H^2(\mathcal{F}(-t)) = 0$  and that  $\omega_Y(4-t) \otimes \mathcal{F}$  has a global section vanishing at no point of  $Y$ . Then by [1, Sect.3] there is an extension:

$$0 \longrightarrow \mathcal{F} \longrightarrow E \longrightarrow I_{Y \cup S}(t) \longrightarrow 0$$

with  $E$  a rank 3 vector bundle on  $P$ . The Chern classes of  $E$  are:

$$c_1(E) = c_1(\mathcal{F}) + t$$

$$c_2(E) = c_2(\mathcal{F}) + t c_1(\mathcal{F}) + \deg Y$$

$$c_3(E) = -c_3(\mathcal{F}) + t c_2(\mathcal{F}) + (c_1(\mathcal{F}) - t + 4) \deg Y - 2 \chi(\mathcal{O}_Y)$$

However, the condition  $H^2(\mathcal{F}(-t))=0$  is too strong for our purposes. In the next two propositions we shall consider two cases in which this condition is not necessarily fulfilled but a locally free extension still exists.

Proposition 1.1. Let  $\mathcal{F}$  be a rank 2 reflexive sheaf on  $P$  which can be realized as an extension (1) and let  $S$  be the singular scheme of  $\mathcal{F}$ . Suppose that  $\omega_Z(4+a)$  has a global section vanishing at no point of  $S$ .

Then there is an extension:

$$0 \longrightarrow \mathcal{F} \longrightarrow E \longrightarrow I_S \longrightarrow 0$$

with  $E$  a rank 3 vector bundle on  $P$ .

Proof. Dualizing (1), one gets an exact sequence:

$$0 \longrightarrow \mathcal{O}_P(-b) \longrightarrow \mathcal{F}^* \longrightarrow I_Z(-a) \longrightarrow 0 \quad (2)$$

Dualizing (2), one finds an exact sequence:

$$0 \longrightarrow \mathcal{O}_P(a) \longrightarrow \mathcal{F} \longrightarrow \mathcal{O}_P(b) \longrightarrow \mathcal{E}xt^1(I_Z(-a), \mathcal{O}_P) \longrightarrow \mathcal{E}xt^1(\mathcal{F}^*, \mathcal{O}_P) \longrightarrow 0$$

We have  $\mathcal{E}xt^1(I_Z(-a), \mathcal{O}_P) \cong \omega_Z(4+a)$ . Let  $\eta$  be a global section of  $\omega_Z(4+a)$  vanishing at no point of  $S$ .  $\eta$  determines a global section  $\eta_0$  of  $\mathcal{E}xt^1(\mathcal{F}^*, \mathcal{O}_P)$  which generates  $\mathcal{E}xt^1(\mathcal{F}^*, \mathcal{O}_P)$  as an  $\mathcal{O}_P$ -module. From the commutative diagram:

$$\begin{array}{ccc} H^0(\mathcal{E}xt^1(I_Z(-a), \mathcal{O}_P)) & \longrightarrow & H^0(\mathcal{E}xt^1(\mathcal{F}^*, \mathcal{O}_P)) \\ \downarrow & & \downarrow \\ 0 = H^2(\mathcal{H}om(I_Z(-a), \mathcal{O}_P)) & \longrightarrow & H^2(\mathcal{H}om(\mathcal{F}^*, \mathcal{O}_P)) \end{array}$$

it follows that by the canonical morphism  $H^0(\mathcal{E}xt^1(\mathcal{F}^*, \mathcal{O}_P)) \longrightarrow H^2(\mathcal{F})$

$\eta_0$  goes into 0. Hence  $\eta_0$  is the image of an element  $e_0 \in \mathcal{E}xt^1(\mathcal{F}^*, \mathcal{O}_P)$ .

Let:

$$0 \longrightarrow \mathcal{O}_P \longrightarrow E_0 \longrightarrow \mathcal{F}^* \longrightarrow 0 \quad (3)$$

be the extension determined by  $e_0$ . Dualizing (3) one gets an exact sequence:

$$0 \longrightarrow \mathcal{F} \longrightarrow E_0^* \longrightarrow \mathcal{O}_P \longrightarrow \mathcal{E}xt^1(\mathcal{F}^*, \mathcal{O}_P) \longrightarrow \mathcal{E}xt^1(E_0, \mathcal{O}_P) \longrightarrow 0$$

From the fact that  $\eta_0$  generates the  $\mathcal{O}_P$ -module  $\mathcal{E}xt^1(\mathcal{F}^*, \mathcal{O}_P)$  it follows that  $\mathcal{E}xt^1(E_0, \mathcal{O}_P) = 0$ , hence  $E_0$  is locally free, and that  $\text{Im}(E_0^* \longrightarrow \mathcal{O}_P) = I_S$ .  $E = E_0^*$  is a rank 3 vector bundle on  $P$  and we have an exact sequence:

$$0 \longrightarrow \mathcal{F} \longrightarrow E \longrightarrow I_S \longrightarrow 0$$

Proposition 1.2. Let  $\mathcal{F}$  be a rank 2 reflexive sheaf on  $P$  satisfying the hypothesis of (1.1) and let  $S$  be the singular scheme of  $\mathcal{F}$ . Let  $d \geq 1$  and  $e \geq 1$  be integers. Suppose that  $\mathcal{F}(d+e)$  has a global section  $s$  vanishing in codimension  $\geq 2$ .

If  $Y \subset P$  is a complete intersection of two surfaces of degree  $d$  and  $e$ , respectively, such that  $s$  vanishes at no point of  $Y$ , then there is an extension

$$0 \longrightarrow \mathcal{F} \longrightarrow E \longrightarrow I_{Y \cup S} \longrightarrow 0$$

with  $E$  a rank 3 vector bundle on  $P$ .

Proof. We have an exact sequence:

$$\mathcal{E}xt^1(I_{Y \cup S}, \mathcal{F}) \longrightarrow H^0(\mathcal{E}xt^1(I_{Y \cup S}, \mathcal{F})) \longrightarrow H^2(\mathcal{H}om(I_{Y \cup S}, \mathcal{F}))$$

and isomorphisms:  $\mathcal{H}om(I_{Y \cup S}, \mathcal{F}) \cong \mathcal{F}$ ,  $\mathcal{E}xt^1(I_{Y \cup S}, \mathcal{F}) \cong \mathcal{E}xt^1(I_Y, \mathcal{F}) \oplus \mathcal{E}xt^1(I_S, \mathcal{F})$  and  $\mathcal{E}xt^1(I_Y, \mathcal{F}) \cong \omega_Y(4) \otimes \mathcal{F} \cong \mathcal{F}(d+e)|_Y$ .

By (1.1) there is an  $e_2 \in \mathcal{E}xt^1(I_S, \mathcal{F})$  which determines an extension:

$$0 \longrightarrow \mathcal{F} \longrightarrow E_2 \longrightarrow I_S \longrightarrow 0$$

with  $E_2$  locally free. Let  $e'_2$  be the image of  $e_2$  in  $H^0(\mathcal{E}xt^1(I_S, \mathcal{F}))$ .

Now, we want to describe the morphism  $H^0(\mathcal{E}xt^1(I_Y, \mathcal{F})) \rightarrow H^2(\mathcal{F})$ . We consider the canonical locally free resolution of

$$I_Y: \quad 0 \rightarrow \mathcal{O}_P(-d-e) \rightarrow \mathcal{O}_P(-d) \oplus \mathcal{O}_P(-e) \rightarrow I_Y \rightarrow 0 \quad (4)$$

Applying  $\mathcal{H}om(-, \mathcal{F})$  to (4) one gets an exact sequence:

$$0 \rightarrow \mathcal{H}om(I_Y, \mathcal{F}) \rightarrow \mathcal{F}(d) \oplus \mathcal{F}(e) \rightarrow \mathcal{F}(d+e) \rightarrow \mathcal{E}xt^1(I_Y, \mathcal{F}) \rightarrow 0$$

which decomposes into two short exact sequences:

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{F}(d) \oplus \mathcal{F}(e) \rightarrow (I_Y \cdot \mathcal{F})(d+e) \rightarrow 0$$

$$0 \rightarrow (I_Y \cdot \mathcal{F})(d+e) \rightarrow \mathcal{F}(d+e) \rightarrow \mathcal{F}(d+e)|_Y \rightarrow 0$$

The morphism  $H^0(\mathcal{E}xt^1(I_Y, \mathcal{F})) \rightarrow H^2(\mathcal{F})$  is equal to the composition of the morphisms  $\delta_1: H^0(\mathcal{F}(d+e)|_Y) \rightarrow H^1((I_Y \cdot \mathcal{F})(d+e))$  and  $\delta_2: H^1((I_Y \cdot \mathcal{F})(d+e)) \rightarrow H^2(\mathcal{F})$ . The section  $s \in H^0(\mathcal{F}(d+e))$  restricts to a section  $e'_1 \in H^0(\mathcal{F}(d+e)|_Y)$  which vanishes at no point of  $Y$  and such that  $\delta_1(e'_1) = 0$ .

It follows that the element  $(e'_1, e'_2) \in H^0(\mathcal{E}xt^1(I_{Y \cup S}, \mathcal{F}))$  goes into 0 by the morphism  $H^0(\mathcal{E}xt^1(I_{Y \cup S}, \mathcal{F})) \rightarrow H^2(\mathcal{F})$ , hence it is the image of an element  $e' \in \mathcal{E}xt^1(I_{Y \cup S}, \mathcal{F})$ .  $e'$  determines the extension we are looking for.

Next, we show that the stable rank 2 reflexive sheaves produced by R. Miró in [7] satisfy the hypotheses of (1.1) and (1.2) if they are constructed with some care.

Lemma 1.3. Let  $Z_1, Z_2$  be nonsingular (connected) curves in  $P$  such that the scheme  $Z_1 \cap Z_2$  is nonempty and consists of finitely many simple points, and let  $Z = Z_1 \cup Z_2$ . Let  $D = Z_1 \cap Z_2$  considered as a divisor on  $Z_1$  or  $Z_2$ . Then:

(i)  $Z$  is l.c.i. in  $P$

(ii)  $\omega_Z|_{Z_i} \cong \omega_{Z_i} \otimes \mathcal{O}_{Z_i}(D)$ ,  $i=1,2$

(iii) If, for some  $n \in \mathbb{Z}$ , the restriction  $H^0(\mathcal{O}_Z(n)) \rightarrow H^0(\mathcal{O}_{Z_1}(n))$  is surjective then the restriction  $H^0(\omega_Z(-n)) \rightarrow$

$\rightarrow H^0(\omega_Z(-n)|_{Z_2})$  is surjective.

(iv)  $\omega_Z(1)$  is generated by its global sections.

Proof. (i) Let  $x \in Z_1 \cap Z_2$ . One can choose a regular system of parameters  $u, v, w$  of  $\mathcal{O}_{P,x}$  such that  $I_{Z_1,x} = (u, v)$  and  $I_{Z_2,x} = (u, w)$ . Then  $I_{Z,x} = I_{Z_1,x} \cap I_{Z_2,x} = (u, vw)$ .

(ii) We start with the exact sequence:

$$0 \rightarrow I_{Z_1}/I_Z \rightarrow \mathcal{O}_Z \rightarrow \mathcal{O}_{Z_1} \rightarrow 0$$

But  $I_{Z_1}/I_Z = I_{Z_1}/(I_{Z_1} \cap I_{Z_2}) \cong (I_{Z_1} + I_{Z_2})/I_{Z_2} = \mathcal{O}_{Z_2}(-D)$ . Hence we obtain an exact sequence of  $\mathcal{O}_P$ -modules:

$$0 \rightarrow \mathcal{O}_{Z_2}(-D) \rightarrow \mathcal{O}_Z \rightarrow \mathcal{O}_{Z_1} \rightarrow 0 \quad (5)$$

Applying  $\text{Ext}^2(-, \omega_P)$  to (5) one gets an exact sequence :

$$0 \rightarrow \omega_{Z_1} \rightarrow \omega_Z \rightarrow \omega_{Z_2} \otimes \mathcal{O}_{Z_2}(D) \rightarrow 0 \quad (6)$$

Restricting to  $Z_2$ , we get an epimorphism  $\omega_Z|_{Z_2} \rightarrow \omega_{Z_2} \otimes \mathcal{O}_{Z_2}(D)$ .

But this is an epimorphism of invertible  $\mathcal{O}_{Z_2}$ -modules, hence it is an isomorphism.  $\sim$

(iii) We consider the exact cohomology sequence associated to (6) twisted with  $-n$  :

$$H^0(\omega_Z(-n)) \rightarrow H^0(\omega_{Z_2}(-n) \otimes \mathcal{O}_{Z_2}(D)) \rightarrow H^1(\omega_{Z_1}(-n)) \rightarrow H^1(\omega_Z(-n))$$

It follows that we have to show that the morphism  $H^1(\omega_{Z_1}(-n)) \rightarrow H^1(\omega_Z(-n))$  is injective. If  $\varphi \in H^0(\mathcal{O}_Z(n))$  then the diagram:

$$\begin{array}{ccc} H^1(\omega_{Z_1}) & \xrightarrow{\quad} & H^1(\omega_Z) \\ \downarrow H^1(\varphi|_{Z_1}) & & \downarrow H^1(\varphi) \\ H^1(\omega_{Z_1}(-n)) & \xrightarrow{\quad} & H^1(\omega_Z(-n)) \end{array}$$

is commutative. We have an exact sequence:

$$H^1(\omega_{Z_1}) \longrightarrow H^1(\omega_Z) \longrightarrow H^1(\omega_{Z_2} \otimes \mathcal{O}_{Z_2}(D))$$

But  $H^1(\omega_{Z_2} \otimes \mathcal{O}_{Z_2}(D)) \cong H^0(\mathcal{O}_{Z_2}(-D))' = 0$  and  $H^1(\omega_{Z_1}) \cong k$ . It follows that the morphism  $H^1(\omega_{Z_1}) \longrightarrow H^1(\omega_Z)$  is an isomorphism.

We have proved that the morphism  $H^1(\omega_{Z_1}(-n)) \rightarrow H^1(\omega_Z(-n))$  is the dual of the morphism  $H^0(\mathcal{O}_Z(n)) \rightarrow H^0(\mathcal{O}_{Z_1}(n))$ . Now, the assertion follows from our hypothesis.

(iv)  $H^0(\mathcal{O}_{Z_i}(-1)) = 0$  hence, by (iii), the morphism  $H^0(\omega_Z(1)) \rightarrow H^0(\omega_Z(1)|_{Z_i})$  is surjective,  $i=1,2$ . Using (ii) it follows that  $\deg(\omega_Z(1)|_{Z_i}) \geq 2g(Z_i)$  hence  $\omega_Z(1)|_{Z_i}$  is generated by its global sections,  $i=1,2$ . It follows that  $\omega_Z(1)$  is generated by its global sections.

Example 1.4. Let  $q \geq 1$  and  $c_2 \geq 1$  be integers such that  $c_2 \geq 2q-2$ . Let  $\Sigma_1, \Sigma_2$  be nonsingular surfaces in  $P$  of degree  $q-1$  and  $q$ , respectively, intersecting transversally. Put  $Z_2 = \Sigma_1 \cap \Sigma_2$ . Let  $H$  be a plane in  $P$  which intersects transversally  $\Sigma_1, \Sigma_2$  and  $Z_2$ . Put  $C_i = H \cap \Sigma_i$ ,  $i=1,2$ . Let  $Z_1 \subset H$  be a nonsingular curve of degree  $c_2$  passing through  $r$  of the points of  $H \cap Z_2$ ,  $0 \leq r \leq q(q-1)$ , and let  $Z = Z_1 \cup Z_2$ . One can construct a stable rank 2 reflexive sheaf  $\mathcal{F}$  on  $P$  using an extension:

$$0 \longrightarrow \mathcal{O}_P(-q) \longrightarrow \mathcal{F} \longrightarrow I_Z(q-1) \longrightarrow 0$$

The Chern classes of  $\mathcal{F}$  are:  $c_1(\mathcal{F}) = -1$ ,  $c_2(\mathcal{F}) = c_2$ ,  $c_3(\mathcal{F}) = c_2^2 - 2(q-1)c_2 + 2r$  (see [7, Sect.2] for details).

Firstly, we investigate under which conditions  $\mathcal{F}$  satisfies the hypothesis of (1.1). The extension (7) is determined by a global section  $\xi$  of  $\omega_Z(5-2q)$  vanishing only at finitely many points. If  $L$  is an invertible  $\mathcal{O}_Z$ -module then we have an exact sequence:

$$0 \rightarrow H^0(L) \rightarrow H^0(L|_{Z_1}) \times H^0(L|_{Z_2}) \rightarrow H^0(L|_{Z_1 \cap Z_2}).$$

Put  $D=Z_1 \cap Z_2$ . By (1.3),  $\omega_Z(5-2q)|_{Z_1} \cong \mathcal{O}_{Z_1}(c_2-(2q-2)) \otimes \mathcal{O}_{Z_1}(D)$  and  $\omega_Z(5-2q)|_{Z_2} \cong \mathcal{O}_{Z_2}(D)$ . Choose  $s_i \in H^0(\mathcal{O}_{Z_i}(D))$  such that the divisor of zeros of  $s_i$  is  $D$ ,  $i=1,2$ , and let  $t_1 \in H^0(\mathcal{O}_{Z_1}(c_2-(2q-2)))$  be a nonzero section. We may take  $\tilde{S}=(t_1 \otimes s_1, s_2)$ .

It follows that, in order to verify the hypothesis of (1.1), it suffices to find a global section of  $\omega_Z(4-q)$  vanishing at no point of  $D$ . This happens, for example, if  $D=\emptyset$ . Now, suppose that  $D \neq \emptyset$ .

The morphism  $H^0(\mathcal{O}_P(q-4)) \rightarrow H^0(\mathcal{O}_{Z_1}(q-4))$  is surjective. By (1.3 iii), the morphism  $H^0(\omega_Z(4-q)) \rightarrow H^0(\omega_Z(4-q)|_{Z_2})$  is surjective, hence it suffices to find a global section of  $\omega_Z(4-q)|_{Z_2}$  vanishing at no point of  $D$ . Put  $D_2=(H \cap Z_2) \setminus D$ . We have:

$$\omega_Z(4-q)|_{Z_2} \cong \mathcal{O}_{Z_2}(q-1) \otimes \mathcal{O}_{Z_2}(D) \cong \mathcal{O}_{Z_2}(q) \otimes \mathcal{O}_{Z_2}(-D_2)$$

One can identify  $H^0(\mathcal{O}_{Z_2}(q) \otimes \mathcal{O}_{Z_2}(-D_2))$  with the global sections of  $\mathcal{O}_{Z_2}(q)$  vanishing at any point of  $D_2$ . Hence we must find a global section of  $\mathcal{O}_{Z_2}(q)$  vanishing at any point of  $D_2$  but at no point of  $D$ . The morphisms  $H^0(\mathcal{O}_P(q)) \rightarrow H^0(\mathcal{O}_{Z_2}(q))$  and  $H^0(\mathcal{O}_P(q)) \rightarrow H^0(\mathcal{O}_{C_1}(q))$  being surjective, it suffices to find a global section of  $\mathcal{O}_{C_1}(q)$  vanishing at any point of  $D_2$  but at no point of  $D$ . Now,  $\mathcal{O}_{C_1}(q) \otimes \mathcal{O}_{C_1}(-D_2) \cong \mathcal{O}_{C_1}(D)$ . Hence we must find a global section of  $\mathcal{O}_{C_1}(D)$  vanishing at no point of  $D$ . Such a section exists if and only if:

$$h^0(\mathcal{O}_{C_1}(D-x)) = h^0(\mathcal{O}_{C_1}(D)) - 1 \text{ for any } x \in D \text{ (see [5; IV, 3.1]).}$$

By the Theorem of Riemann-Roch this is equivalent to:

$$h^0(\omega_{C_1}(-D+x)) = h^0(\omega_{C_1}(-D)) \text{ for any } x \in D.$$

Now, we show how one can choose  $D \subseteq H \cap Z_2 = C_1 \cap C_2$  such that  $h^0(\omega_{C_1}(-D+x))=0$  for any  $x \in D$ . We have  $\omega_{C_1} \cong \mathcal{O}_{C_1}(q-4)$ . Using the exact sequence:

$$0 \longrightarrow \mathcal{O}_H(-2q+1) \longrightarrow \mathcal{O}_H(-q) \oplus \mathcal{O}_H(-q+1) \longrightarrow I_{C_1 \cap C_2} \longrightarrow 0$$

one finds that  $h^0(I_{C_1 \cap C_2}(q-4))=0$ , hence if  $\sigma \in H^0(\omega_{C_1})$  vanishes at any point of  $C_1 \cap C_2$  then  $\sigma=0$ . It follows that there is a set  $T \subset C_1 \cap C_2$  consisting of  $h^0(\omega_{C_1}) = \frac{1}{2} \cdot (q-2)(q-3)$  points such that, if  $\sigma \in H^0(\omega_{C_1})$  vanishes at any point of  $T$  then  $\sigma=0$ .

Let  $y_1, \dots, y_g$  be the points of  $T$  and let  $\sigma_i \in H^0(\omega_{C_1})$  be the unique (up to scalar) section vanishing at  $y_1, \dots, y_{i-1}, y_{i+1}, \dots, y_g$  but not at  $y_i$ .  $\sigma_1, \dots, \sigma_g$  is a basis of  $H^0(\omega_{C_1})$  hence for any  $x \in C_1$ , there is an  $i$  such that  $\sigma_i(x) \neq 0$ . It follows that for any  $x \in C_1 \setminus T$  there is an  $f \in H^0(\mathcal{O}_{C_1}(q))$  which vanishes at any point of  $T$  but not at  $x$ . Indeed, choose  $\sigma_i$  such that  $\sigma_i(x) \neq 0$  and  $\lambda \in H^0(\mathcal{O}_{C_1}(1))$  such that  $\lambda(y_i)=0$  and  $\lambda(x) \neq 0$ . We may take  $f = \lambda^4 \cdot \sigma_i$ .

We have proved that the base locus of the linear system of the curves of degree  $q$  in  $H$  passing through the points of  $T$  is  $T$ . It follows that, moving  $C_2$  (in fact  $\Sigma_2$ ) if necessary, we may suppose that, for any  $i$ ,  $\sigma_i$  vanishes at no point of  $(C_1 \cap C_2) \setminus T$ .

Now, suppose that  $T \subset D \subseteq C_1 \cap C_2$ . Let  $x \in D$ . If  $\sigma \in H^0(\omega_{C_1})$  vanishes at any point of  $D \setminus \{x\}$  then  $\sigma=0$ , hence  $H^0(\omega_{C_1}(-D+x)) = 0$ .

We have proved that if  $r=0$  or if  $\frac{1}{2}(q-2)(q-3)+1 \leq r \leq q(q-1)$  then one can construct  $\mathcal{F}$  such that it satisfies the hypothesis of (1.1).

One can similarly prove, using the curve  $C_2$  instead of  $C_1$ , that if  $r=0$  or if  $\frac{1}{2}(q-1)(q-2)+1 \leq r \leq q(q-1)$  then one can construct  $\mathcal{F}$  such that  $\mathcal{F}(-1)$  satisfies the hypothesis of (1.1).

Next, we show that if  $q \geq 2$  then, for any  $n \geq 1$ ,  $\mathcal{F}(n)$  has a global section vanishing in codimension  $\geq 2$ . Firstly, we show that for any  $d \geq q-1$  there is an irreducible surface of degree  $d$  in  $P$  containing  $Z_2$  but not  $Z_1$ . We may suppose  $d \geq q+1$ . Then the base locus of the linear system of the surfaces of degree  $d$  containing  $Z_2$  is  $Z_2$  and this linear system separates the points of  $P \setminus Z_2$ . By the Theorem of Bertini, the general surface of degree  $d$  containing  $Z_2$  is irreducible.

Now, let  $n \geq 1$  be an integer. Let  $h=0$  be an equation of the plane  $H$  and let  $g=0$  be an equation of an irreducible surface of degree  $n+q-2$  containing  $Z_2$  but not  $Z_1$ . Let  $s$  be a global section of  $\mathcal{F}(n)$  which goes into  $h \cdot g \in H^0(I_Z(n+q-1))$ . If  $s$  vanishes in codimension 1 then there is an  $m < n$ , an  $s' \in H^0(\mathcal{F}(m))$  and an  $f \in H^0(\mathcal{O}_P(n-m))$  such that  $s = f \cdot s'$ . Let  $g'$  be the image of  $s'$  in  $H^0(I_Z(m+q-1))$ . We have  $f \cdot g' = h \cdot g$ . By unique factorization,  $g' = h$  or  $g' = g$ , but none of them vanishes on  $Z$  and this is a contradiction.

such that  $c_2 \geq 2q-1$ .

Example 1.5. Let  $q \geq 1$  and  $c_2 \geq 2$  be integers  $\checkmark$ . Let  $Z_2 \subset P$  be a complete intersection of two surface of degree  $q$  and let  $Z_1$  be a plane curve of degree  $c_2$  such that  $Z_1$  meets  $Z_2$  at  $r$  simple points,  $0 \leq r \leq q^2$ . Put  $Z = Z_1 \cup Z_2$ . One can construct a stable rank 2 reflexive sheaf  $\mathcal{F}$  on  $P$  as an extension:

$$0 \longrightarrow \mathcal{O}_P(-q) \longrightarrow \mathcal{F} \longrightarrow I_Z(q) \longrightarrow 0$$

The Chern classes of  $\mathcal{F}$  are:  $c_1(\mathcal{F})=0$ ,  $c_2(\mathcal{F})=c_2$ ,  $c_3(\mathcal{F}) = c_2^2 - (2q-1)c_2 + 2r$  (see [7, Sect.2] for details).

One can show, as in (1.4), that if  $r=0$  or if  $\frac{1}{2} \cdot (q-1)(q-2) + 1 \leq r \leq q^2$  then one can construct  $\mathcal{F}$  such that  $\mathcal{F}(-1)$  satisfies the hypothesis of (1.1). Also, if  $n \geq 1$  then  $\mathcal{F}(n)$  has a global section vanishing in codimension  $\geq 2$ .

We end the section with an example of a semistable rank 3 vector bundle on  $P$  with  $c_1=0$ , which will be used in the sections 3 and 4.

Example 1.6. Let  $q \geq 1$  and  $c_2 \geq 2q$  be integers. Let  $Z_1, Z_2$  be plane curves in  $P$  of degree  $c_2-q$  and  $q$ , respectively, contained in different planes  $H_1$  and  $H_2$  and such that  $Z_1$  meets  $Z_2$  at  $s$  simple points,  $0 \leq s \leq q$ . Put  $Z = Z_1 \cup Z_2$ . Let  $H$  be a plane which intersects transversally  $Z_1$  and  $Z_2$  and which does not contain any point of  $H_1 \cap H_2 \cap Z$ . Put  $L_i = H \cap H_i$ ,  $i=1,2$ .

There are elements  $t_1, t_2 \in H^0(\mathcal{O}_Z(1))$  which generate  $\mathcal{O}_Z(1)$  and such that  $t_1$  vanishes at any point of  $H \cap Z_2$  and  $t_2$  vanishes at any point of  $H \cap Z_1$ .  $\omega_Z(3)$  is generated by its global sections, hence we can find  $\sigma_1, \sigma_2 \in H^0(\omega_Z(3))$  such that  $\xi_1 = t_1 \cdot \sigma_1$  and  $\xi_2 = t_2 \cdot \sigma_2$  generate  $\omega_Z(4)$ .  $\xi_1$  and  $\xi_2$  determine an extension:

$$0 \longrightarrow \mathcal{O}_P^2 \longrightarrow E \longrightarrow I_Z \longrightarrow 0$$

with  $E$  a semistable rank 3 vector bundle on  $P$  with Chern classes:  $c_1(E)=0$ ,  $c_2(E)=c_2$ ,  $c_3(E)=c_2^2-(2q-1)c_2+2q^2+2s$ .

We assert that for any  $n \geq 1$  there is an epimorphism  $E_H \longrightarrow \mathcal{O}_H(n)$ . Indeed, dualizing the exact sequence:

$$0 \longrightarrow \mathcal{O}_H^2 \longrightarrow E_H \longrightarrow I_{Z \cap H} \longrightarrow 0$$

one gets an exact sequence:

$$0 \longrightarrow \mathcal{O}_H \longrightarrow E_H^* \longrightarrow \mathcal{O}_H^2 \longrightarrow \omega_{Z \cap H}(4) \longrightarrow 0$$

The morphism  $\mathcal{O}_H^2 \longrightarrow \omega_{Z \cap H}(4)$  is determined by  $\xi_1|_H$  and  $\xi_2|_H$ .

It follows that the image of the morphism  $H^0(E_H^*(n)) \longrightarrow$

$\longrightarrow H^0(\mathcal{O}_H(n))^2$  consists of the pairs  $(f_1, f_2)$  such that  $f_i$  vanishes at any point of  $H \cap Z_i$ ,  $i=1,2$ . Let  $\lambda_1, \lambda_2 \in H^0(\mathcal{O}_H(1))$  be such that  $\lambda_i=0$  is an equation of  $L_i$ ,  $i=1,2$ , and let  $\lambda_0 \in H^0(\mathcal{O}_H(1))$  be

a linear form which does not vanish at the point  $x$  where  $L_1$  and  $L_2$  intersect. Let  $\varphi_0$  be the epimorphism  $E_H \rightarrow I_Z \cap H$ .

Let  $\varphi$  be a global section of  $E_H^*(n)$  whose image in  $H^0(\mathcal{O}_H(n))^2$  is  $(\lambda_1^n, \lambda_2^n)$  vanishes only at the point  $x$ . It follows that  $\varphi$  might vanish only at  $x$ . If  $\varphi$  vanishes at  $x$  then the global section  $\varphi + \lambda_0^n \cdot \varphi_0$  of  $E_H^*(n)$ , whose image in  $H^0(\mathcal{O}_H(n))^2$  is still  $(\lambda_1^n, \lambda_2^n)$ , vanishes at no point of  $H$ .

## 2. Examples of Stable Rank 3 Vector Bundles with $c_1=0$ .

With some exceptions, the bundles considered in this section are constructed as extensions:

$$0 \rightarrow \mathcal{F} \rightarrow E \rightarrow I_Y \cup_S(1) \rightarrow 0 \quad (1)$$

where  $\mathcal{F}$  is a stable rank 2 reflexive sheaf on  $P$  as in (1.4) and  $Y$  is a plane curve of degree  $d \geq 2$ . One can verify the stability of  $E$  as it follows. In every case one has  $S \neq \emptyset$ , hence we may suppose  $H^0(I_Y \cup_S(1))=0$ . It follows that  $H^0(E)=0$ . Dualizing (1) one gets an exact sequence:

$$0 \rightarrow \mathcal{O}_P(-1) \rightarrow E^* \rightarrow \mathcal{F}^* \rightarrow \omega_Y(3) \rightarrow 0$$

If  $c_2 \geq 3$  then  $\mathcal{F}^* \cong \mathcal{F}(1)$  has only one (up to scalar) global section  $s$ . We may suppose that  $s|_Y \neq 0$ , hence the morphism  $H^0(\mathcal{F}^*) \rightarrow H^0(\mathcal{F}^*|_Y)$  is injective.  $\omega_Y(3) \cong \mathcal{O}_Y(d)$  and  $\det \mathcal{F}^* \cong \mathcal{O}_P(1)$ , hence we have an exact sequence:

$$0 \rightarrow \mathcal{O}_Y(1-d) \rightarrow \mathcal{F}^*|_Y \rightarrow \omega_Y(3) \rightarrow 0$$

It follows that the morphism  $H^0(\mathcal{F}^*|_Y) \rightarrow H^0(\omega_Y(3))$  is injective, hence  $H^0(E^*)=0$ .

Example 2.1. Let  $q \geq 3$  and  $c_2 \geq 2q-2$  be integers. Let  $\mathcal{F}$  be a stable rank 2 reflexive sheaf on  $P$  constructed as an extension:

$$0 \rightarrow \mathcal{O}_P(-q+1) \rightarrow \mathcal{F} \rightarrow I_Z(q-2) \rightarrow 0$$

where  $Z=Z_1 \cup Z_2$ , with  $Z_1$  a plane curve of degree  $c_0-1$  and  $Z_2$  a

complete intersection of two surfaces of degree  $q-2$  and  $q-1$ , respectively, such that  $Z_1$  meets  $Z_2$  at  $r$  simple points.

We construct a stable rank 3 vector bundle  $E$  on  $P$  as an extension:

$$0 \longrightarrow \mathcal{F} \longrightarrow E^* \longrightarrow I_{Y \cup S}(1) \longrightarrow 0$$

where  $Y$  is a conic. According to (1.4), if  $r=0$  or if  $\frac{1}{2}(q-2)(q-3)+1 \leq r \leq (q-1)(q-2)$  then the construction is possible. The Chern classes of  $E$  are:  $c_1(E)=0$ ,  $c_2(E)=c_2$ ,  $c_3(E)=c_2^2-(2q-1)c_2+2(q-2)+2r$ .

This example covers all the values of  $c_3$  with  $c_3 = c_2^2 - (2q-1)c_2 + 2(q-2)$  or with  $c_2^2 - (2q-1)c_2 + (q-1)(q-2) + 2 \leq c_3 \leq c_2^2 - (2q-1)c_2 + 2q(q-2)$ .

Example 2.2. Let  $\mathcal{F}$  be a stable rank 2 reflexive sheaf on  $P$  constructed as an extension:

$$0 \longrightarrow \mathcal{O}_P(-1) \longrightarrow \mathcal{F} \longrightarrow I_L \longrightarrow 0$$

where  $L$  is a line. The Chern classes of  $\mathcal{F}$  are:  $c_1(\mathcal{F})=-1$ ,  $c_2(\mathcal{F})=1$ ,  $c_3(\mathcal{F})=1$ . We have  $H^2(\mathcal{F}(-1))=0$ , and  $\mathcal{F}(1)$  is generated by its global sections. It follows that if  $Y$  is a l.c.i. curve in  $P$  with  $\omega_Y(2)$  generated by its global sections then  $\omega_Y(3) \otimes \mathcal{F}$  has a section vanishing at no point of  $Y$ . In this case there is an extension:

$$0 \longrightarrow \mathcal{F} \longrightarrow E \longrightarrow I_{Y \cup S}(1) \longrightarrow 0$$

with  $E$  a rank 3 vector bundle on  $P$ . Let  $Y_1, \dots, Y_n$  be the connected components of  $Y$ . If there is an  $i$  such that  $h^0(\omega_{Y_1}(2)^*)=0$  or if  $h^0(\omega_{Y_1}(2)^*)=1$  and  $n \geq 2$  then  $E$  is stable (see [1; Sect.3, Example 2] for details).

Now, let  $q \geq 1$  and  $c_2 \geq 2$  be integers such that  $c_2 \geq 2q-2$ .

Let  $Y=Y_1 \cup Y_2$ , where  $Y_1$  is a plane curve of degree  $c_2-q+1$  and  $Y_2$  a plane curve of degree  $q-1$ , situated in different planes and such that  $Y_1$  meets  $Y_2$  in  $s$  simple points,  $0 \leq s \leq q-1$ . In this

case the Chern classes of  $E$  are:  $c_1(E)=0$ ,  $c_2(E)=c_2$ ,  $c_3(E)=c_2^2 - (2q-1)c_2 + 2q(q-2) + 2(s+1)$ .

This example covers all the values of  $c_3$  with:

$$c_2^2 - (2q-1)c_2 + 2q(q-2) + 2 \leq c_3 \leq c_2^2 - (2q-1)c_2 + 2q(q-1)$$

Example 2.3. Let  $d \geq 1$ ,  $q \geq \max(2d, 3)$  and  $c_2 \geq q+1$  be integers. Let  $\mathcal{F}$  be a stable rank 2 reflexive sheaf on  $P$  constructed as an extension:

$$0 \longrightarrow \mathcal{O}_P(-d-1) \longrightarrow \mathcal{F} \longrightarrow I_Z(d) \longrightarrow 0$$

where  $Z=Z_1 \cup Z_2$ , with  $Z_1$  a plane curve of degree  $q$  and  $Z_2$  a complete intersection of two surface of degree  $d$  and  $d+1$ , respectively, such that  $Z_1$  meets  $Z_2$  at  $r$  simple points.

We construct a stable rank 3 vector bundle  $E$  on  $P$  as an extension:

$$0 \longrightarrow \mathcal{F} \longrightarrow E \longrightarrow I_{Y \cup S}(1) \longrightarrow 0$$

where  $Y$  is a plane curve of degree  $c_2 - q + 1$ . According to (1.4), if  $\frac{1}{2} \cdot d(d-1) + 1 \leq r \leq d(d+1)$  then the construction is possible. The Chern classes of  $E$  are:  $c_1(E)=0$ ,  $c_2(E)=c_2$ ,  $c_3(E)=c_2^2 - (2q-1)c_2 + 2dq - 2r$ .

Example 2.4. Let  $d \geq 1$ ,  $q \geq d+2$  and  $c_2 \geq q+d$  be integers. Let  $\mathcal{F}$  be a stable rank 2 reflexive sheaf on  $P$  constructed as an extension:

$$0 \longrightarrow \mathcal{O}_P(-d-1) \longrightarrow \mathcal{F} \longrightarrow I_Z(d) \longrightarrow 0$$

where  $Z=Z_1 \cup Z_2$ , with  $Z_1$  a plane curve of degree  $c_2 - q + d + 1$  and  $Z_2$  a complete intersection of two surfaces of degree  $d$  and  $d+1$ , respectively, such that  $Z_1$  meets  $Z_2$  at  $r$  simple points.

We construct a stable rank 3 vector bundle  $E$  on  $P$  an extension:

$$0 \longrightarrow \mathcal{F} \longrightarrow E^* \longrightarrow I_{Y \cup S}(1) \longrightarrow 0$$

where  $Y$  is a plane curve of degree  $q-d$ . According to (1.4), if

$\frac{1}{2} \cdot d(d-1) + 1 \leq r \leq d(d+1)$  then the construction is possible. The Chern classes of  $E$  are:  $c_1(E)=0$ ,  $c_2(E)=c_2$ ,  $c_3(E)=c_2^2-(2q-1)c_2 + 2dq-2d(d+1)+2r$ .

The examples (2.3) and (2.4) cover all the values of  $c_3$  with  $c_2^2-(2q-1)c_2+2dq-2d(d+1) \leq c_3 \leq c_2^2-(2q-1)c_2+2dq$ . Now, let  $\tilde{d}$  be the largest integer for which  $2\tilde{d} \leq q$ . We have  $2\tilde{d}q \geq (q-1)(q-2)$ . It follows that the examples from (2.1) to (2.4) cover all the values of  $c_3$  with  $c_3 \in M_0(q, c_2)$ , except  $c_3 = c_2^2-(2q-1)c_2+2(q^2-q+1)$  and  $c_3 = c_2^2-(2q-1)c_2$ .

Example 2.5. Let  $q \geq 2$  and  $c_2 \geq 3$  be integers such that  $c_2 \geq 2q-2$ .

Let  $E'$  be a stable rank 3 vector bundle on  $P$  with Chern classes  $c'_1 = -1$ ,  $c'_2 = q$ ,  $c'_3 = q^2 - 2q + 2$  (see [8, (5.8)]). Let  $H \subset P$  be a plane which contains a generic line of  $E'$ . By [8, (5.8)],  $E'(q-1)$  is generated by its global sections, hence the same is true for  $E'_H(c_2 - q + 1)$ . It follows that  $E'_H(c_2 - q + 1)$  has a global section vanishing at no point of  $H$ , hence there is an epimorphism

$\alpha_H : E'^* \longrightarrow \mathcal{O}_H(c_2 - q + 1)$ . Composing with the morphism  $E'^* \longrightarrow E'^*_H$  we get an epimorphism  $\alpha : E'^* \longrightarrow \mathcal{O}_H(c_2 - q + 1)$ . Let  $E^* = \text{Ker } \alpha$ .  $E$  is a rank 3 vector bundle on  $P$  and, by definition, there is an exact sequence:

$$0 \longrightarrow E^* \longrightarrow E'^* \xrightarrow{\alpha} \mathcal{O}_H(c_2 - q + 1) \longrightarrow 0$$

Dualizing, we get an exact sequence

$$0 \longrightarrow E' \longrightarrow E \longrightarrow \mathcal{O}_H(-c_2 + q) \longrightarrow 0$$

The Chern classes of  $E$  are  $c_1(E)=0$ ,  $c_2(E)=c_2$ ,  $c_3(E)=c_2^2-(2q-1)c_2 + 2(q^2-q+1)$ . In order to show that  $E$  is stable it suffices to show that  $H^0(\alpha)$  is injective. We have  $H^0(E'^*(-1))=0$ , hence the morphism  $H^0(E'^*) \longrightarrow H^0(E'^*_H)$  is injective. Now, let  $F_H = \text{Ker } \alpha_H$ . Dualizing the exact sequence:

$$0 \longrightarrow F_H \longrightarrow E'^*_H \xrightarrow{\alpha_H} \mathcal{O}_H(c_2 - q + 1) \longrightarrow 0$$

and using the fact that  $H^0(E'_H(-1))=0$  one finds that  $H^0(F_H^*(-1))=0$ . But  $F_H^*(-1) \cong F_H(c_2-q-1)$ , hence  $H^0(F_H)=0$ . It follows that  $H^0(\alpha_H)$  is injective.

Example 2.6. Let  $q \geq 1$  and  $c_2 \geq 2$  be integers such that  $c_2 \geq 2q-1$ . Let  $E'$  be a stable rank 3 vector bundle on  $P$  with Chern classes  $c'_1 = -1$ ,  $c'_2 = q$ ,  $c'_3 = -q^2$ . By [8, Sect.5], there is an exact sequence

$$0 \longrightarrow E' \longrightarrow \mathcal{O}_P^3 \longrightarrow \mathcal{O}_{H_0}(q) \longrightarrow 0$$

for some plane  $H_0 \subset P$ . Let  $F_{H_0} = \text{Ker}(\mathcal{O}_{H_0}^3 \longrightarrow \mathcal{O}_{H_0}(q))$ . Using the Snake lemma, as in [2, (1.1)], one gets an exact sequence:

$$0 \longrightarrow \mathcal{O}_P(-1)^3 \longrightarrow E' \longrightarrow F_{H_0} \longrightarrow 0$$

$F_{H_0}^*$  is generated by its global sections. But  $F_{H_0}^* \cong F_{H_0}(q)$ . It follows that  $E'(q)$  is generated by its global sections.

Let  $H \subset P$  be a plane which contains a generic line of  $E'$ . One can construct, as in (2.5), a stable rank 3 vector bundle  $E$  on  $P$  as an extension:

$$0 \longrightarrow E' \longrightarrow E \longrightarrow \mathcal{O}_H(-c_2+q) \longrightarrow 0$$

The Chern classes of  $E$  are  $c_1(E)=0$ ,  $c_2(E)=c_2$ ,  $c_3(E)=c_2^2-(2q-1)c_2$ .

Now, let  $\bar{q}$  be the largest integer for which  $2\bar{q}-1 \leq c_2$  and  $\bar{d}=d_0(\bar{q})$ .  $c_2^2-(2\bar{q}-1)c_2+2(\bar{q}^2-\bar{q}+1)$  is equal to  $\frac{1}{2}c_2^2+2$  if  $c_2$  is even and to  $\frac{1}{2}(c_2^2+3)$  if  $c_2$  is odd. It follows that the examples from (2.1) to (2.6) cover all the possible values of  $c_3$  with  $c_3 \geq c_2^2-(2\bar{q}-1)c_2+2\bar{d}\bar{q}-2\bar{d}(\bar{d}+1) := m_0(c_2)$ .

The remaining values of  $c_3$  are covered by:

Example 2.7. Let  $c_2 \geq 2$  be an integer. Let  $\mathcal{F}$  be a stable rank 2 reflexive sheaf on  $P$  as in (2.2). We construct a stable rank 3 vector bundle  $E$  on  $P$  as an extension:

$$0 \longrightarrow \mathcal{F} \longrightarrow E \longrightarrow \mathcal{I}_{V,1,c}(1) \longrightarrow 0$$

Mod 21343

where  $Y$  is a l.c.i. curve in  $P$  satisfying the conditions stated at the beginning of (2.2).

Let  $d$  be an integer with  $0 \leq d \leq c_2 - 1$ . If  $Y$  is a disjoint union of  $c_2 - d - 1$  lines and of a rational curve of degree  $d + 1$  then the Chern classes of  $E$  are:  $c_1(E) = 0$ ,  $c_2(E) = c_2$ ,  $c_3(E) = 2d$ .

If  $Y$  is a nonsingular curve of degree  $c_2$  and of genus  $g$  then  $c_1(E) = 0$ ,  $c_2(E) = c_2$ ,  $c_3(E) = 2c_2 - 2 + 2g$ . According to [4], there are such curves for all  $g$  with  $0 \leq g \leq \frac{1}{6} \cdot c_2(c_2 - 3) + 1$ .

It follows that this example covers all the values of  $c_3$  with  $0 \leq c_3 \leq \frac{1}{3} \cdot c_2(c_2 + 3)$ . One can easily see that  $\frac{1}{3} \cdot c_2(c_2 + 3) \geq m_0(c_2)$  for all  $c_2 \geq 2$ .

### 3. Examples of Stable Rank 3 Vector Bundles with $c_1 = -1$

Example 3.1. Let  $q \geq 1$  and  $c_2 \geq 2q$  be integers. Let  $\mathcal{F}$  be a stable rank 2 reflexive sheaf on  $P$  constructed as an extension:

$$0 \longrightarrow \mathcal{O}_P(-q) \longrightarrow \mathcal{F} \longrightarrow I_Z(q) \longrightarrow 0$$

where  $Z = Z_1 \cup Z_2$ , with  $Z_1$  a plane curve of degree  $c_2$  and  $Z_2$  a complete intersection of two surfaces of degree  $q$  such that  $Z_1$  meets  $Z_2$  at  $r$  simple points. We construct a stable rank 3 vector bundle  $E$  on  $P$  as an extension:

$$0 \longrightarrow \mathcal{F}(-1) \longrightarrow E^*(-1) \longrightarrow I_S \longrightarrow 0$$

According to (1.5), if  $r = 0$  or if  $\frac{1}{2} \cdot (q-1)(q-2) + 1 \leq r \leq q^2$  then the construction is possible. The Chern classes of  $E$  are  $c_1(E) = -1$ ,  $c_2(E) = c_2$ ,  $c_3(E) = c_2^2 - 2qc_2 + 2r$ .

This example covers all the value of  $c_3$  with  $c_3 = c_2^2 - 2qc_2$  or with  $c_2^2 - 2qc_2 + (q-1)(q-2) + 2 \leq c_3 \leq c_2^2 - 2qc_2 + 2q^2$ .

Example 3.2. Let  $d \geq 1$ ,  $q \geq 2d$  and  $c_2 \geq q$  be integers. Let  $\mathcal{F}$  be a stable rank 2 reflexive sheaf on  $P$  constructed as an extension:

$$0 \longrightarrow \mathcal{O}_P(-d-1) \longrightarrow \mathcal{F} \longrightarrow I_Z(d) \longrightarrow 0$$

where  $Z=Z_1 \cup Z_2$ , with  $Z_1$  a plane curve of degree  $q$  and  $Z_2$  a complete intersection of two surfaces of degree  $d$  and  $d+1$ , respectively, such that  $Z_1$  meets  $Z_2$  at  $r$  simple points. We construct a stable rank 3 vector bundle  $E$  on  $P$  as an extension:

$$0 \longrightarrow \mathcal{F} \longrightarrow E \longrightarrow I_{Y \cup S} \longrightarrow 0$$

where  $Y$  is a plane curve of degree  $c_2 - q$ . According to (1.4), if  $\frac{1}{2} \cdot (d-1)(d-2) + 1 \leq r \leq d(d+1)$ , then the construction is possible. The Chern classes of  $E$  are  $c_1(E) = -1$ ,  $c_2(E) = c_2$ ,  $c_3(E) = c_2^2 - 2qc_2 + 2dq - 2r$ .

Example 3.3. Let  $d \geq 1$ ,  $q \geq d$  and  $c_2 \geq q+d$  be integers. Let  $\mathcal{F}$  be a stable rank 2 reflexive sheaf on  $P$  constructed as an extension:

$$0 \longrightarrow \mathcal{O}_P(-d) \longrightarrow \mathcal{F} \longrightarrow I_Z(d) \longrightarrow 0$$

where  $Z=Z_1 \cup Z_2$ , with  $Z_1$  a plane curve of degree  $c_2 - q + d$  and  $Z_2$  a complete intersection of two surfaces of degree  $d$  such that  $Z_1$  meets  $Z_2$  at  $r$  simple points. We construct a stable rank 3 vector bundle  $E$  on  $P$  as an extension:

$$0 \longrightarrow \mathcal{F}(-1) \longrightarrow E^*(-1) \longrightarrow I_{Y \cup S} \longrightarrow 0$$

where  $Y$  is a plane curve of degree  $q - d$ . According to (1.5), if  $\frac{1}{2} \cdot (d-1)(d-2) + 1 \leq r \leq d^2$  then the construction is possible. The Chern classes of  $E$  are:  $c_1(E) = -1$ ,  $c_2(E) = c_2$ ,  $c_3(E) = c_2^2 - 2qc_2 + 2dq - 2d^2 + 2r$ .

Example 3.4. Let  $d \geq 1$ ,  $q \geq d+1$  and  $c_2 \geq q+d$  be integers. Let  $E'$  be a semistable rank 3 vector bundle on  $P$  constructed, as in (1.6), as an extension:

$$0 \longrightarrow \mathcal{O}_P^2 \longrightarrow E' \longrightarrow I_Z \longrightarrow 0$$

where  $Z=Z_1 \cup Z_2$ , with  $Z_1$  a plane curve of degree  $c_2 - q$  and  $Z_2$  a plane curve of degree  $d$  such that  $Z_1$  meets  $Z_2$  at  $s$  simple points,  $0 \leq s \leq d$ . Let  $H$  be the plane considered in (1.6). The generic splitting type of  $E'$  is  $(0,0,0)$  and  $H$  contains a generic line of  $E'$ . By (1.6), there is an epimorphism  $E' \rightarrow \mathcal{O}_H(q-d)$ . Let  $E$  be

the kernel of this epimorphism. We have, by definition, an exact sequence :

$$0 \longrightarrow E \longrightarrow E' \longrightarrow \mathcal{O}_H(q-d) \longrightarrow 0$$

It follows, as in (2.5), that  $E$  is a stable rank 3 vector bundle on  $P$  with Chern classes:  $c_1(E) = -1$ ,  $c_2(E) = c_2$ ,  $c_3(E) = c_2^2 - 2qc_2 + 2dq + 2s$ .

The examples from (3.2) to (3.4) cover all the values of  $c_3$  with  $c_2^2 - 2qc_2 + 2dq - 2d(d+1) \leq c_3 \leq c_2^2 - 2qc_2 + 2dq + 2d$ . Now, let  $\tilde{d}$  be the largest integer for which  $2\tilde{d} \leq q$ . Then  $2\tilde{d}q + 2\tilde{d} \geq (q-1)(q-2)$ . It follows that the examples from (3.1) to (3.4) cover all the values of  $c_3$  with  $c_3 \in M_1(q, c_2)$ .

Let  $\bar{q}$  be the largest integer for which  $2\bar{q} \leq c_2$  and  $\bar{d} = d_1(\bar{q})$ .  $c_2^2 - 2\bar{q}c_2 + 2\bar{q}^2$  is equal to  $\frac{1}{2} \cdot c_2^2$  if  $c_2$  is even and to  $\frac{1}{2} \cdot (c_2^2 + 1)$  if  $c_2$  is odd. It follows that the examples from (3.1) to (3.4) cover all the possible values of  $c_3$  with  $c_3 \geq c_2^2 - 2\bar{q}c_2 + 2\bar{d}q - 2\bar{d}(\bar{d}+1) : = m_1(c_2)$ .

The remaining values of  $c_3$  are covered by:

Example 3.5. Let  $c_2 \geq 1$  be an integer. We construct a rank 3 vector bundle  $E$  on  $P$  as an extension:

$$0 \longrightarrow \mathcal{O}_P(-1)^2 \longrightarrow E \longrightarrow I_Y(1) \longrightarrow 0$$

where  $Y$  is a l.c.i. curve in  $P$  with  $\omega_Y(2)$  generated by its global sections and such that  $H^0(I_Y(1)) = 0$ . The extension is determined by two global sections  $\xi_1, \xi_2$  of  $\omega_Y(2)$  which generate this sheaf. If  $\xi_1$  and  $\xi_2$  are linearly independent over  $k$  then  $E$  is stable (as one can easily see dualizing the extension).

Let  $2 \leq d \leq c_2 + 1$  be an integer. If  $Y$  is a disjoint union of  $d-1$  lines and of a rational curve of degree  $c_2 - d + 2$  then the Chern classes of  $E$  are:  $c_1(E) = -1$ ,  $c_2(E) = c_2$ ,  $c_3(E) = c_2 + 2 - 2d$ .

If  $c_2 \geq 2$  and  $Y$  is a rational curve of degree  $c_2+1$  then:  
 $c_1(E) = -1$ ,  $c_2(E) = c_2$ ,  $c_3(E) = c_2$ .

Now, suppose that  $c_2 \geq 3$ . If  $Y$  is a nonsingular curve of degree  $c_2+1$  and of genus  $g$  contained in no plane then the Chern classes of  $E$  are :  $c_1(E) = -1$ ,  $c_2(E) = c_2$ ,  $c_3(E) = c_2+2g$ . According to [4], there are such curves for all  $g$  with  $0 \leq g \leq \frac{1}{6} \cdot (c_2+1)(c_2-2)+1$ .

It follows that, for  $c_2 \geq 3$ , this example covers all the values of  $c_3$  with  $-c_2 \leq c_3 \leq \frac{1}{3} \cdot (c_2+1)^2+1$ . One can easily see that  $\frac{1}{3} \cdot (c_2+1)^2+1 \geq m_1(c_2)$  for all  $c_2 \geq 3$ .

#### 4. Examples of Stable Rank 3 Vector Bundles with $c_1 = -2$

Example 4.1. Let  $q \geq 1$  and  $c_2 \geq 2q$  be integers. Let  $\mathcal{F}$  be a stable rank 2 reflexive sheaf on  $P$  constructed as an extension:

$$0 \longrightarrow \mathcal{O}_P(-q) \longrightarrow \mathcal{F} \longrightarrow I_Z(q-1) \longrightarrow 0$$

where  $Z = Z_1 \cup Z_2$ , with  $Z_1$  a plane curve of degree  $c_2-1$  and  $Z_2$  a complete intersection of two surfaces of degree  $q-1$  and  $q$ , respectively, such that  $Z_1$  meets  $Z_2$  at  $r$  simple points. We construct a stable rank 3 vector bundle  $E$  on  $P$  as an extension:

$$0 \longrightarrow \mathcal{F} \longrightarrow E^*(-1) \longrightarrow I_S \longrightarrow 0$$

According to (1.4), if  $r=0$  or if  $\frac{1}{2} \cdot (q-2)(q-3)+1 \leq r \leq q(q-1)$  then the construction is possible. The Chern classes of  $E$  are:  $c_1(E) = -2$ ,  $c_2(E) = c_2$ ,  $c_3(E) = c_2^2 - (2q+1)c_2 + 2q + 2r$ .

This example covers all the values of  $c_3$  with  $c_3 = c_2^2 - (2q+1)c_2 + 2q$  or with  $c_2^2 - (2q+1)c_2 + 2q + (q-2)(q-3) + 2 \leq c_3 \leq c_2^2 - (2q+1)c_2 + 2q$ .

Example 4.2. Let  $d \geq 1$ ,  $q \geq \sqrt{\max(2d, 3)}$  and  $c_2 \geq q$  be integers. Let  $\mathcal{F}$  be a stable rank 2 reflexive sheaf on  $P$  constructed as an extension:

$$0 \longrightarrow \mathcal{O}_P(-d) \longrightarrow \mathcal{F} \longrightarrow I_Z(d) \longrightarrow 0$$

where  $Z=Z_1 \cup Z_2$ , with  $Z_1$  a plane curve of degree  $q-1$  and  $Z_2$  a complete intersection of two surfaces of degree  $d$  such that  $Z_1$  meets  $Z_2$  at  $r$  simple points. We construct a stable rank 3 vector bundle  $E$  on  $P$  as an extension:

$$0 \longrightarrow \mathcal{F}(-1) \longrightarrow E \longrightarrow I_{Y \cup S} \longrightarrow 0$$

where  $Y$  is a plane curve of degree  $c_2 - q$ . According to (1.5), if  $\frac{1}{2} \cdot (d-1)(d-2) + 1 \leq r \leq d^2$  then the construction is possible. The Chern classes of  $E$  are:  $c_1(E) = -2$ ,  $c_2(E) = c_2$ ,  $c_3(E) = c_2^2 - (2q+1)c_2 + 2(d+1)q - 2d - 2r$ .

Example 4.3. Let  $d \geq 1$ ,  $q \geq d+1$  and  $c_2 \geq q+d$  be integers. Let  $\mathcal{F}$  be a stable rank 2 reflexive sheaf on  $P$  constructed as an extension:

$$0 \longrightarrow \mathcal{O}_P(-d-1) \longrightarrow \mathcal{F} \longrightarrow I_Z(d) \longrightarrow 0$$

where  $Z=Z_1 \cup Z_2$ , with  $Z_1$  a plane curve of degree  $c_2 - q + d$  and  $Z_2$  a complete intersection of two surfaces of degree  $d$  and  $d+1$ , respectively, such that  $Z_1$  meets  $Z_2$  at  $r$  simple points. We construct a stable rank 3 vector bundle  $E$  on  $P$  as an extension:

$$0 \longrightarrow \mathcal{F} \longrightarrow E^*(-1) \longrightarrow I_{Y \cup S} \longrightarrow 0$$

where  $Y$  is a plane curve of degree  $q - d - 1$ . According to (1.4), if  $\frac{1}{2} \cdot (d-1)(d-2) + 1 \leq r \leq d(d+1)$  then the construction is possible. The Chern classes of  $E$  are:  $c_1(E) = -2$ ,  $c_2(E) = c_2$ ,  $c_3(E) = c_2^2 - (2q+1)c_2 + 2(d+1)q - 2d(d+1) + 2r$ .

Example 4.4. Let  $d \geq 1$ ,  $q \geq 2d+1$  and  $c_2 \geq q+1$  be integers. Let  $E'$  be a semistable rank 3 vector bundle on  $P$  constructed, as in (1.6), as an extension:

$$0 \longrightarrow \mathcal{O}_P^2 \longrightarrow E' \longrightarrow I_Z \longrightarrow 0$$

where  $Z=Z_1 \cup Z_2$ , with  $Z_1$  a plane curve of degree  $q - d - 1$  and  $Z_2$  a plane curve of degree  $d$  such that  $Z_1$  meets  $Z_2$  at  $s$  simple points,  $0 \leq s \leq d$ . Let  $H$  be the plane considered in (1.6). By (1.6), there is an epimorphism  $E' \longrightarrow \mathcal{O}_H(c_2 - q)$ . Let  $E^*(-1)$  be the kernel of

this epimorphism. We have, by definition, an exact sequence:

$$0 \longrightarrow E^*(-1) \longrightarrow E' \longrightarrow \mathcal{O}_H(c_2 - q) \longrightarrow 0$$

It follows that  $E$  is a stable rank 3 vector bundle on  $P$  with Chern classes:  $c_1(E) = -2$ ,  $c_2(E) = c_2$ ,  $c_3(E) = c_2^2 - (2q+1)c_2 + 2(d+1)q - 2d(d+1) - 2s$ .

The examples from (4.2) to (4.4) cover all the values of  $c_3$  with  $c_2^2 - (2q+1)c_2 + 2(d+1)q - 2d(d+2) \leq c_3 \leq c_2^2 - (2q+1)c_2 + 2(d+1)q$ .

Now, let  $\tilde{d}$  be the largest integer for which  $2\tilde{d}+1 \leq q$ . Then  $2(\tilde{d}+1)q \geq 2q + (q-2)(q-3)$ . It follows that the examples from (4.1) to (4.4) cover all the values of  $c_3$  with  $c_3 \in M_2(q, c_2)$ .

Let  $\bar{q}$  be the largest integer for which  $2\bar{q} \leq c_2$  and  $\bar{d} = d_2(\bar{q})$ .  $c_2^2 - (2\bar{q}+1)c_2 + 2\bar{q}^2$  is equal to  $\frac{1}{2} \cdot (c_2^2 - 2c_2)$  if  $c_2$  is even and to  $\frac{1}{2} \cdot (c_2 - 1)^2$  if  $c_2$  is odd. It follows that the examples from (4.1) to (4.4) cover all the values of  $c_3$  with  $c_3 \geq c_2^2 - (2\bar{q}+1)c_2 + 2(\bar{d}+1)\bar{q} - 2\bar{d}(\bar{d}+2) := m_2(c_2)$ .

The remaining values of  $c_3$  are covered by:

Example 4.5. Let  $c_2 \geq 2$  be an integer. We construct a rank 3 vector bundle  $E$  on  $P$  as an extension:

$$0 \longrightarrow \mathcal{O}_P(-1)^2 \longrightarrow E \longrightarrow I_Y \longrightarrow 0$$

where  $Y$  is a l.c.i. curve in  $P$  with  $\omega_Y(3)$  generated by its global sections. The extension is determined by two global sections  $\xi_1, \xi_2$  of  $\omega_Y(3)$  which generate this sheaf. If  $\xi_1$  and  $\xi_2$  are linearly independent over  $k$  then  $E$  is stable.

Let  $1 \leq d \leq c_2 - 1$  be an integer. If  $Y$  is a disjoint union of  $d-1$  lines and of a rational curve of degree  $c_2 - d$  then the Chern classes of  $E$  are:  $c_1(E) = -2$ ,  $c_2(E) = c_2$ ,  $c_3(E) = 2c_2 - 2 - 2d$ .

If  $Y$  is a nonsingular curve of degree  $c_2 - 1$  and of genus  $g$  then the Chern classes of  $E$  are:  $c_1(E) = -2$ ,  $c_2(E) = c_2$ ,  $c_3(E) =$

According to [4], there are such curves for all  $g$  with  $0 \leq g \leq \frac{1}{6} \cdot (c_2 - 1)(c_2 - 4) + 1$ .

It follows that this example covers all the values of  $c_3$  with  $0 \leq c_3 \leq \frac{1}{3} \cdot (c_2 - 1)(c_2 + 2)$ . One can easily see that :  $\frac{1}{3} \cdot (c_2 - 1)(c_2 + 2) \geq m_2(c_2)$  for all  $c_2 \geq 2$ .
