NONDISCRETE LOCAL RAMIFIED CLASS FIELD THEORY

by

Adrian IOVITA and Alexandru ZAHARESCU

§1. INTRODUCTION

Let p be a prime, \mathbb{Q}_p = the field of p -adic numbers, \mathcal{K} = the algebraic closure of \mathbb{Q}_p and $\overline{\mathcal{K}}$ the (topologic) completion of \mathcal{K} . We consider the problem of describing the finite abelian extensions of a complete subfield K of $\overline{\mathcal{K}}$. In this paper we study this problem for those K which have finite residual fields and for which the exponent of p in the Steinitz number $[K : \mathbb{Q}_p]$ is finite.

We give a description for the ramification of the finite abelian extensions of such a field K by means of some subgroups of finite index of $U(K)$, which coincide in the discrete case (i.e. when K/\mathbb{Q}_p is finite) with that given by the classical local class field theory.

We shall use the ideas of [2] and [3]. More precisely, via the one-to-one correspondence (given in §3) between the set of complete subfields of $\overline{\mathcal{K}}$ and the set of subextensions of \mathcal{K}/\mathbb{Q}_p , we shall reduce the situations involving K to similar ones involving an increasing sequence of local fields, for which we shall apply the results of [3].

We conclude this introduction by noting that a description of the set of all finite abelian extensions of K is no more similar that given in the discrete case (one has to consider here some projective limits) and that in the case when p divides the infinite part of the Steinitz number $[K : \mathbb{Q}_p]$ a description of the finite abelian extensions of K by means of the subgroups of norms is no more possible.

§2. NOTATIONS

In what follows p will be a prime number, \mathbb{Q}_p the field of p -adic numbers, \mathcal{R} the algebraic closure of \mathbb{Q}_p and $\bar{\mathcal{R}}$ the completion of \mathcal{R} with respect to the unique extension of the p -adic valuation. The valuation on $\bar{\mathcal{R}}$ (normalised such that $v(p) = 1$) will be denoted by v . We shall use also the notations: \bar{M} for the (topologic) completion of any subset $M \subseteq \bar{\mathcal{R}}$ and k_v for the residual field of any subfield k of $\bar{\mathcal{R}}$. $\mathcal{F}(\mathcal{R}/\mathbb{Q}_p)$ will denote the set of fields k , $\mathbb{Q}_p \subseteq k \subseteq \mathcal{R}$, and $\mathcal{F}_c(\bar{\mathcal{R}}/\mathbb{Q}_p)$ will denote the set of fields K , $\mathbb{Q}_p \subseteq K \subseteq \bar{\mathcal{R}}$ such that K is complete. If l/k is a finite Galois extension then $\text{Gal}(l/k)_{\text{ram}} = \text{Gal}(l/k_0)$ where k_0 is the maximal unramified subextension of l/k .

Let $\mathbb{Q}_p \subseteq k \subseteq \mathcal{R}$ such that k_v is finite or is algebraic closed. Choose a sequence of fields $k_1 \subseteq k_2 \subseteq \dots \subseteq k$ such that $\bigcup_{i \geq 1} k_i = k$ and all the k_i are finite extensions of \mathbb{Q}_p if k_v is finite, and respectively of $(\mathbb{Q}_p)_{\text{nr}}$ (the maximal unramified extension of \mathbb{Q}_p in \mathcal{R}) if k_v is algebraic closed. If l/k is finite and Galois, and $l = k(\alpha)$, let $l_i = k_i(\alpha)$. Then there exists an $n_0 \in \mathbb{N}$ such that l_n/k_n is Galois and $\text{Gal}(l_n/k_n) \simeq \text{Gal}(l/k)$ for any $n \geq n_0$. Moreover $l = \bigcup_{i \geq 1} l_i$.

Any field $\mathbb{Q}_p \subseteq k \subseteq \mathcal{R}$ defines a Steinitz number $[k : \mathbb{Q}_p]$ which contains prime factors which have finite or infinite exponents. The product of those factors which have the exponent ∞ will be denoted by $[k : \mathbb{Q}_p]_{\infty}$.

We define similarly $[k : (\mathbb{Q}_p)_{\text{nr}}]_{\infty}$ if $(\mathbb{Q}_p)_{\text{nr}} \subseteq k \subseteq \mathcal{R}$.

§3. SUBFIELDS IN $\bar{\mathcal{R}}$

There is a canonical one-to-one correspondence between $\mathcal{F}(\mathcal{R}/\mathbb{Q}_p)$ and $\mathcal{F}_c(\bar{\mathcal{R}}/\mathbb{Q}_p)$. We summarize in the following Theorem some results regarding it which are used in this paper.

THEOREM 3.1. a) The maps defined by $\mathcal{F}(\mathcal{R}/\mathbb{Q}_p) \ni k \mapsto \bar{k} \in \mathcal{F}_c(\bar{\mathcal{R}}/\mathbb{Q}_p)$ and

$\mathcal{F}_c(\bar{\Omega}/Q_p) \ni K \mapsto K \cap \Omega \in \mathcal{F}(\Omega/Q_p)$ are one-to-one and inverse each to the other.

b) Let $k, l \in \mathcal{F}(\Omega/Q_p)$ such that l/k is finite and Galois. Then \bar{l}/\bar{k} is finite and Galois and one has $\text{Gal}(l/k) \simeq \text{Gal}(\bar{l}/\bar{k})$, the isomorphism being the canonic one.

c) Let $K, L \in \mathcal{F}_c(\bar{\Omega}/Q_p)$ such that L/K is finite and Galois. Denote: $k = K \cap \Omega$ and $l = L \cap \Omega$. Then l/k is finite and Galois and one has $\text{Gal}(l/k) \simeq \text{Gal}(L/K)$, the isomorphism being the canonic one.

Proof. (a) We have to prove that:

(1°) $\bar{k} \cap \Omega = k$ for any $k \in \mathcal{F}(\Omega/Q_p)$

(2°) $\overline{K \cap \Omega} = K$ for any $K \in \mathcal{F}_c(\bar{\Omega}/Q_p)$

Let $k \in \mathcal{F}(\Omega/Q_p)$ and let $a \in \bar{k} \cap \Omega$. Denote by $a_1 = a, a_2, \dots, a_n$ the conjugates of a over Q_p . Since $a \in \bar{k}$ there exists $b \in k$ such that $v(a - b) > v(a - a_i)$ for any i . By Krasner's lemma it follows that $Q_p(a) \subseteq Q_p(b) \subseteq k$, which proves (1°).

Let $K \in \mathcal{F}_c(\bar{\Omega}/Q_p)$ and denote $k = K \cap \Omega$. Then $\bar{k} \subseteq K$. Now fix an element z of K and a real number δ . Choose an $\alpha \in \Omega$ such that $v(z - \alpha) > \delta$ and denote by $\alpha_1 = \alpha, \alpha_2, \dots, \alpha_n$ the conjugates of α over k . They are also the conjugates of α over \bar{k} and over K since k is algebraic closed in K . Then $\alpha_1 - z, \dots, \alpha_n - z$ are the conjugates of $\alpha - z$ over K . As a consequence we have: $v(\alpha_i - z) = v(\alpha - z) > \delta$ for any i , and we derive: $\Delta(\alpha) = \inf_{2 \leq i \leq n} (v(\alpha - \alpha_i)) > \delta$.

From [1], Proposition 1, it follows that there exists an $a \in \bar{k}$ such that:

$$v(\alpha - a) \geq \Delta(\alpha) - \frac{p}{(p-1)^2}$$

Hence $v(z - a) > \delta - \frac{p}{(p-1)^2}$. Since δ was arbitrary one obtain finally $z \in \bar{k}$, which proves (2°) and (a).

(b) One has the equality $\bar{l} = \bar{k} \cdot l$, which implies that \bar{l}/\bar{k} is finite, Galois and that $\text{Res} : \text{Gal}(\bar{l}/\bar{k}) \rightarrow \text{Gal}(l/k)$ is a monomorphism.

From (a) it follows that k is algebraic closed in \bar{k} . Then

$$|\text{Gal}(\bar{l}/\bar{k})| = [\bar{l} : \bar{k}] = [l : k] = \text{Gal}(l/k)$$

and this completes the proof of (b).

(c) It suffices to show that l/k is finite and Galois (the isomorphism follows then from (a) and (b)). Since for any finite extension l' of k contained in l one has, as in (b):

$$[l' : k] = [\bar{l}' : \bar{k}] \leq [\bar{l} : \bar{k}]$$

it follows that l/k is finite. Now let $\sigma \in \text{Gal}(\Omega/k)$. Since σ is an isometry one may extend it by continuity to an element $\bar{\sigma}$ of $\text{Gal}(\bar{\Omega}/\bar{k})$. \bar{l}/\bar{k} being Galois one has $\bar{\sigma}(\bar{l}) \subseteq \bar{\Omega} \cap \bar{\sigma}(\bar{l}) = \bar{\Omega} \cap \bar{l} = \bar{l}$. Thus l/k is Galois and the proof of Theorem 3.1 is complete.

THEOREM 3.2. Let $Q_p \subseteq k \subseteq \Omega$ such that k_v is finite and $p \nmid [k : Q_p]_\infty$.

Then any cyclic extension l/k of prime degree $q/[k : Q_p]_\infty$ is inertial (i.e. $[l_v : k_v] = q$).

Proof. Let $|k_v| = p^h$.

(a) Suppose that $q \nmid p^h - 1$. Let $Q_p \subseteq k_1 \subseteq k_2 \subseteq \dots \subseteq k$ be a sequence of finite extensions of Q_p such that $\bigcup_{i \geq 1} k_i = k$. Let $l = k(\alpha)$ and $l_i = k_i(\alpha)$. Choose an n_0 such that:

$[l_{n_0} : k_{n_0}] = q$, $(k_{n_0})_v = k_v$ and $m = [k_{n_0+1} : k_{n_0}]$ be divisible by q but not by p .

We may suppose that l_{n_0}/k_{n_0} is totally ramified (if not, then $[(l_{n_0})_v : (k_{n_0})_v] = q$, hence $[l_v : k_v] = q$). Since k_{n_0+1}/k_{n_0} is also totally ramified, one may choose α and β such that $k_{n_0+1} = k_{n_0}(\beta)$, $l_{n_0} = k_{n_0}(\alpha)$ and α, β are roots of two polynomials of the form $f = x^q - \bar{\pi}$ and respectively $g = x^m - \pi'$, and π' being uniformising elements of k_{n_0} .

Let $u = \frac{\bar{\pi}}{\pi'} \in U(k_{n_0})$ and denote by \bar{u} the image of u in k_v . Since $q \nmid p^h - 1$, $X^q - \bar{u}$ has a root in k_v , hence $X^q - u$ has a root in k_{n_0} .

It follows: $l_{n_0} = k_{n_0}(\beta^{m/q}) \subseteq k_{n_0+1}$ which is impossible.

b) Suppose that $q \mid p^h - 1$. Let, as above, $k_{n_0+1} = k_{n_0}(\beta)$, $l_{n_0} = k_{n_0}(\alpha)$, and

$u = \frac{\pi}{\pi'} \in U(k_{n_0})$. We may suppose that $u \notin [U(k_{n_0})]^q$.

Let $v = \frac{\alpha}{\beta^{m/2}} \in I$. One have $v^q = \frac{\alpha^q}{\beta^m} = \frac{\pi}{\pi'} = u$, hence the image \bar{v} of v in I_v does not lie in k_v . It follows $[(k_{n_0+1} \cdot I_{n_0})_v : k_v] = q$ thus $[I_v : k_v] = q$.

Q.E.D.

THEOREM 3.3. Let $(Q_p)_{nr} \subseteq k \subseteq \Omega$ such that $p \nmid [k : (Q_p)_{nr}]_\infty$. Then the degree of any finite extension of k is relatively prime with $[k : (Q_p)_{nr}]_\infty$.

The proof in the case of cyclic extensions of prime degree is analogous to that of Theorem 3.2 (a). The general case reduces immediately to the Galois case, which reduces to the prime cyclic case by the resolubility of the Galois group.

§4. THE FUNDAMENTAL EXACT SEQUENCE

Let $K, L \subseteq \Omega$ with algebraic closed residual fields.

THEOREM 4.1. Let \bar{L}/\bar{K} be finite and Galois. Then

$$N_{\bar{L}/\bar{K}}(U(\bar{L})) = U(\bar{K})$$

For the proof let us note firstly the following:

LEMMA 4.1. ([3], Cap. 2, Lemma 2 and Theorem 1). Let l/k be a finite Galois extension, where $k \subseteq l \subseteq \Omega$ are complete, discrete, with algebraic closed residual fields. Let π', π uniformising elements of l and k respectively. Then there exists $s \in \mathbb{N}$ such that for any $k \geq s$ and any $u \in k$ with $u \equiv 1 \pmod{\pi'^k}$ there exists an $\bar{z} \in I, \bar{z} \equiv 1 \pmod{\pi'^k}$ such that $N_{l/k}(\bar{z}) = u$. From the proof given there it follows that for l/k cyclic of prime degree we may take

$$s = \frac{v(\pi' - \sigma(\pi'))}{v(\pi')}$$

where σ is a generator of $\text{Gal}(l/k)$; and if

$$k \subseteq k_1 \subseteq k_2 \subseteq \dots \subseteq k_n = l$$

where k_{i+1}/k_i is cyclic of prime degree for any i , and if s_i is defined as above, then we may take $s = \max_{1 \leq i \leq n} \{s_i\}$.

Now let K, L satisfying the above hypothesis, let

$$\left. \begin{array}{l} (Q_p)_{nr} \subseteq k_1 \subseteq k_2 \subseteq \dots \subseteq K \\ (Q_p)_{nr} \subseteq l_1 \subseteq l_2 \subseteq \dots \subseteq L \end{array} \right\} \quad \text{as in } \S 2,$$

and let π_n, π'_n be uniformising elements of k_n and l_n respectively.

Let s_0 be as in the Lemma 4.1. We shall prove that there exists $n_0 \in \mathbb{N}$ and $M \in \mathbb{R}$ such that:

$$s_n v(\pi_n) \leq M \quad \text{for } n \geq n_0$$

Clearly we may reduce to the case when $[L : K] = q$ is a prime. Let n_0 be such that $[l_n : k_n] = q$ for $n \geq n_0$, and let $i \geq n_0$. Then $s_i v(\pi'_i) = v(\pi'_i - \sigma(\pi'_i))$ where $\langle \sigma \rangle = \text{Gal}(l_i/k_i) = \text{Gal}(L/K)$. Let $f(x) = x^q + a_1 x^{q-1} + \dots + a_q$ be the minimal polynomial of π'_i over k_i and let $\pi'_{i1} = \pi'_i, \pi'_{i2} \dots \pi'_{iq}$ be the roots of f . One has:

$$f'(\pi'_i) = (\pi'_i - \pi'_{i2}) \dots (\pi'_i - \pi'_{iq}) = q \pi_i^{q-1} + \dots + a_{q-1}.$$

It follows:

$$\begin{aligned} v(\pi'_i - \sigma(\pi'_i)) &\leq \sum_{j=2}^q v(\pi'_i - \pi'_{ij}) = v(f'(\pi'_i)) = \\ &= \min \{v(q \pi_i^{q-1}), \dots, v(a_{q-1})\} \leq v(q \pi_i^{q-1}) \end{aligned}$$

hence: $s_i v(\pi'_i) \leq q \cdot [v(q) + (q-1)]$.

Now let $u \in U(\overline{K})$. There exist $a_{n_0}, a_{n_0+1}, \dots$, such that

$$\left\{ \begin{array}{l} a_n \in k_n \text{ for any } n \\ \prod_{n=n_0}^{\infty} a_n = u. \end{array} \right.$$

Since $\lim_{n \rightarrow \infty} v(a_n - 1) = \infty$, there exists $m_0 \in \mathbb{N}$ such that

$$v(a_n - 1) \geq s_n v(\pi_n) \quad \text{for } n > m_0$$

From the lemma, there exists $b_n \in \bar{L}_n$ such that $N_{\bar{L}_n/\bar{K}_n}(b_n) = a_n$ and

$$v(b_n - 1) = \frac{v(a_n - 1)}{[L : K]} \quad \text{for } n > m_0.$$

From the discrete case of Theorem 4.1 which is proved in ([3], Cap. 2, § 2.1, Theorem 1)

it follows the existence of an $b_{m_0} \in \bar{L}_{m_0}$ such that

$$N_{\bar{L}_{m_0}/\bar{K}_{m_0}}(b_{m_0}) = a_{n_0} \cdot a_{n_0+1} \cdots a_{m_0}.$$

The product $\prod_{n \geq m_0} b_n$ converges in \bar{L} and its limit b satisfies

$$N_{\bar{L}/\bar{K}}(b) = u.$$

Q.E.D.

K and L being as above, we denote by $V(\bar{L}/\bar{K})$ the subgroup of $U(\bar{L})$ generated by $\left\{ \xi^{-1} = \frac{\sigma(\xi)}{\xi} \mid \xi \in U(L), \sigma \in \text{Gal}(\bar{L}/\bar{K}) \right\}$.

One has: $N_{\bar{L}/\bar{K}}(V(\bar{L}/\bar{K})) = 1$. Let us suppose that $[K : (Q_p)_{nr}]_\infty$ is not divisible by p . Theorem 3.4 implies then that $[L : K]$ and $[K : (Q_p)_{nr}]_\infty$ are relatively prime, hence we may fix an n_0 such that $[k_{i+1} : k_i]$ and $[L : K]$ are relatively prime and $[l_i : k_i] = [L : K]$ for any $i \geq n_0$.

For $n \geq n_0$ and $\sigma \in \text{Gal}(L/K)$ we define:

$$i(\sigma) = (\pi'_n)^{[k_n : k_{n_0}]} \sigma^{-1} \pmod{V(\bar{L}/\bar{K})}$$

where π'_n denotes an uniformising element of l_n .

It is easy to see that $i(\sigma)$ does not depend on the choice of n and π'_n , and that "i" is a homomorphism of groups. Then one has the following sequence of groups:

$$(1) \quad 1 \rightarrow \text{Gal}(\bar{L}/\bar{K}) \xrightarrow{i} U(\bar{L})/V(\bar{L}/\bar{K}) \xrightarrow{N_{L/K}} U(\bar{K}) \rightarrow 1$$

We shall prove in this section that this is an exact sequence.

Clearly the homomorphism $N_{\bar{L}/\bar{K}} \circ i$ is null and $N_{\bar{L}/\bar{K}}$ is onto (Theorem 4.1).

PROPOSITION 4.1. If K, L are as above, L/K is abelian and $[K : (Q_p)_{nr}]_\infty$ is not divisible by p then "i" is a monomorphism.

Proof. a) Suppose firstly that \bar{L}/\bar{K} is cyclic and let ρ be a generator of the Galois group. If $a \in \mathbb{Z}$ is such that $i(\rho^a) = 1$ then there exists $\zeta \in U(L)$ such that

$$(\pi'_{n_0})^{\rho^a - 1} = \frac{\zeta^{\rho^a}}{\zeta}$$

and we get $\rho(\pi'_{n_0} \cdot \zeta^{-1}) = \pi'_{n_0} \cdot \zeta^{-1}$. This implies that

$$\alpha = \pi'_{n_0} \cdot \zeta^{-1} \in \bar{K}.$$

Thus $a = \frac{v(\alpha)}{v(\pi'_{n_0})} = [\bar{L} : \bar{K}] \cdot \frac{v(\alpha)}{v(\pi'_{n_0})}$ is divisible by $[\bar{L} : \bar{K}]$, hence $\rho^a = 1$ and "i" is a monomorphism.

b) If $G = \text{Gal}(\bar{L}/\bar{K})$ is not cyclic, and if $\sigma \in G$, $\sigma \neq 1_{\bar{L}}$, then there exists a subgroup H of G such that $\sigma \notin H$ and G/H is cyclic. Let $M = L^H = \{x \in L / \tau(x) = x, \forall \tau \in H\}$. Then $\bar{M} = \bar{L}^H$ and $[\bar{M} : \bar{K}]$ is relatively prime with $[k_{i+1} : k_i]$ for any $i \geq n_0$, where n_0 is defined as above. We have $\text{Gal}(\bar{M}/\bar{K}) = G/H$. Let $\sigma' = \sigma|_{\bar{M}} \neq 1$. Since $i : \text{Gal}(\bar{M}/\bar{K}) \rightarrow U(\bar{M})/V(\bar{M}/\bar{K})$ is a monomorphism $i(\sigma') \neq 1$. Then:

$$N_{\bar{L}/\bar{M}}(i(\sigma)) = N_{L/M}(\pi'_{n_0}^{\sigma-1}) = (N_{L/M}(\pi'_{n_0}))^{\sigma'-1} = i(\sigma') \neq 1_M.$$

Hence $i(\sigma) \neq 1_{\bar{L}}$ and "i" is a monomorphism.

PROPOSITION 4.2. $\text{Ker}(N_{\bar{L}/\bar{K}}) \subseteq \text{Im}(i)$.

Proof. a) Suppose that \bar{L}/\bar{K} is cyclic and let σ be a generator of the Galois group. If $x \in U(\bar{L})$ satisfies $N_{\bar{L}/\bar{K}}(x) = 1$, then there exists $a \in \bar{L}$ such that $x = a^{\sigma-1}$. Let $a_1, a_2, \dots, a_n, \dots \in L$ such that $a_n \in l_n$ for any n and $\lim_{n \rightarrow \infty} a_n = a$. Let $n_0 \in \mathbb{N}$ be such that $[\bar{L} : \bar{K}]$ is relatively prime with $[k_{i+1} : k_i]$ for any $i \geq n_0$.

There exists $m_0 \geq n_0$ such that $v(a_n) = v(a_{m_0})$ for any $n \geq m_0$. Hence $v(a) = v(a_{m_0})$. Let π'_{m_0} be a uniformising element of l_{m_0} and let $k \in \mathbb{Z}$ be such that $a\pi'_{m_0}^k \in U(\bar{L})$.

Then, since $([\bar{L} : \bar{K}], [k_{m_0} : k_{n_0}]) = 1$, there exists $k' \in \mathbb{N}$ such that

$$x \equiv ((\pi'_{m_0})^{[k_{m_0}:k_{n_0}]} \sigma^{k'-1} \pmod{V(\bar{L}/\bar{K})}), \text{ hence } x = i(\sigma^{k'}).$$

b) Let \bar{L}/\bar{K} be abelian, of degree $n = [\bar{L} : \bar{K}]$. We shall proceed by induction on n . Let as above $n_0 \in \mathbb{N}$ such that $(n, [k_{i+1} : k_i]) = 1$ for $i \geq n_0$.

Let $K \subsetneq M \subseteq L$ such that M/K be cyclic. Let $\zeta \in U(\bar{L})$ such that $N_{\bar{L}/\bar{K}}(\zeta) = 1$ and denote: $\zeta' = N_{\bar{L}/\bar{M}}(\zeta)$. Then $N_{\bar{M}/\bar{K}}(\zeta') = 1$, hence $\zeta' \equiv (\pi'_{n_0})^{\sigma^{-1}-1} \pmod{V(\bar{M}/\bar{K})}$, where π'_{n_0} is an uniformising element of m_{n_0} , $(Q_p)_{nr} \subseteq m_1 \subseteq m_2 \subseteq \dots \subseteq M$ being a sequence of discrete valued fields as in 4.2 (one may choose π'_{n_0} such that $\pi'_{n_0} = N_{L/M}(\pi'_{n_0})$, π'_{n_0} being an uniformising element of l_{n_0}).

Denoting $t = \zeta' \circ [(\pi'_{n_0})^{\sigma^{-1}-1}]^{-1}$, there exists $\eta \in V(\bar{L}/\bar{K})$ such that $t = N_{\bar{L}/\bar{M}}(\eta)$.

One has:

$$N_{\bar{L}/\bar{K}}(\zeta) = \zeta' = [N_{\bar{L}/\bar{M}}(\pi'_{n_0})]^{\sigma^{-1}-1} \cdot N_{\bar{L}/\bar{M}}(\eta) = N_{\bar{L}/\bar{M}}((\pi'_{n_0})^{\sigma^{-1}-1} \cdot \eta)$$

where $\sigma|_M = \sigma'$. Let $\lambda = (\pi'_{n_0})^{\sigma^{-1}-1} \cdot \eta \cdot \zeta'^{-1}$. Since $N_{\bar{L}/\bar{M}}(\lambda) = 1$, from the inductive hypothesis there exists $\zeta \in \text{Gal}(\bar{L}/\bar{M})$ such that

$$\lambda \equiv (\pi'_{n_0})^{\zeta^{-1}-1} \pmod{V(\bar{L}/\bar{M})}$$

Then $\zeta \equiv (\pi'_{n_0})^{\sigma^{-1}-1} \cdot (\pi'_{n_0})^{\zeta^{-1}-1} \pmod{V(\bar{L}/\bar{K})} \equiv (\pi'_{n_0})^{\sigma\zeta^{-1}-1} \pmod{V(\bar{L}/\bar{K})}$, and $\zeta = i(\sigma\zeta^{-1}) \in \text{Im}(i)$. Q.E.D.

We have obtained the following:

THEOREM 4.2. If $p \nmid [K : (Q_p)_{nr}]_\infty$ then the sequence (1) is exact.

PROPOSITION 4.3. Let $(Q_p)_{nr} \subseteq K \subseteq L \subseteq \Omega$ such that L/K is abelian and $p \nmid [K : (Q_p)_{nr}]_\infty$. Then:

a) If $p \nmid [\bar{L} : \bar{K}]$ then "i" may be defined as above and the sequence (1) is exact.

b) If $[L : K] = p^t$, $t \in \mathbb{N}$, then $N_{\bar{L}/\bar{K}} : U(\bar{L})/V(\bar{L}/\bar{K}) \rightarrow U(\bar{K})$ is an isomorphism.

Proof. The proof of a) is analogous to that of Theorem 4.2. In order to prove b), one may reduce to the case $\text{Gal}(\bar{L}/\bar{K})$ cyclic. Let σ be a generator of it. If $x \in U(\bar{L})$ satisfies $N_{\bar{L}/\bar{K}}(x) = 1$ then there exists $a \in \bar{L}$ such that $x = a^{\sigma-1}$. Let $a_n \in L_n$ for $n \geq 1$, such that $\lim_{n \rightarrow \infty} a_n = a$ and let $n_0 \in \mathbb{N}$ such that $v(a_n) = v(a_{n_0}) = v(a_{n_0})$ for any $n \geq n_0$. Then there exists $k \in \mathbb{N}$ such that $x \equiv \pi_{n_0}^{\sigma-1} \pmod{V(\bar{L}/\bar{K})}$. Since $p \nmid [K : (Q_p)_{nr}]_{\infty}$, there exists $m > n_0$ such that $p \nmid [k_m : k_{n_0}]$. Then $x \equiv (\pi_m^{[k_m : k_{n_0}]} \pi_{n_0}^{\sigma-1}) \pmod{V(\bar{L}/\bar{K})} \equiv \pi_m^{\sigma^{[k_m : k_{n_0}]} - 1} \pmod{V(\bar{L}/\bar{K})} \equiv 1 \pmod{V(\bar{L}/\bar{K})}$. Q.E.D.

REMARK. If $(Q_p)_{nr} \subseteq K \subseteq \Omega$, then \bar{K} may have a finite immediate extension Σ , $\bar{K} \subsetneq \Sigma \subseteq \bar{\Omega}$ only if $p \nmid [K : (Q_p)_{nr}]_{\infty}$ and $[\Sigma : \bar{K}] = p^t$, $t \in \mathbb{N}^*$.

For a proof one may apply Theorem 3.3.

§ 5. THE MAXIMAL UNRAMIFIED EXTENSION

In this section we consider a field $Q_p \subseteq k \subseteq \Omega$ with finite residual field k_v such that $p \nmid [k : Q_p]_{\infty}$ and we shall study the maximal unramified extension k_{nr} of k .

PROPOSITION 5.1. Let k be as above and let k_1/k_v be finite, of degree n . Then there exists a unique extension $k \subseteq l \subseteq \Omega$ such that:

- 1) the residual field of l is k_1 ,
- 2) $[l : k] = n$.

It follows that l/k is Galois and cyclic.

The proof follows as is the case: k/Q_p finite.

Let $k^{(n)}$ be the unique extension of k given by Proposition 5.1, and let $k_{nr} = \bigcup_{n \in \mathbb{N}^*} k^{(n)}$.

The extension k_{nr}/k is abelian and one has $k_{nr} = k(V_{\infty})$, where V_{∞} denotes the set of all roots of unity of order $q^n - 1$, $n \in \mathbb{N}^*$ and $q = |k_v|$.

PROPOSITION 5.2. Let $K = k_{nr}$. Then, the residual field K_v of K is the algebraic closure of k_v and one has a canonic topologic isomorphism:

$$\text{Gal}(K/k) \simeq \text{Gal}(K_v/k_v).$$

Again, the proof is like in the case: k/\mathbb{Q}_p finite.

Now we consider the following automorphism of K_v over k_v :

$$\omega \mapsto \omega^q, \text{ for } \omega \in K_v.$$

This corresponds, by the isomorphism of Proposition 5.2, to an automorphism φ of K/k , called the Frobenius automorphism of K/k .

The prolongation by continuity of φ to \bar{K} will be denoted also by φ .

One has the sequence:

$$(2) \quad 1 \rightarrow U(\bar{k}) \xrightarrow{j} U(\bar{K}) \xrightarrow{\varphi-1} U(\bar{K}) \rightarrow 1$$

where j is the inclusion and $(\varphi-1)(z) = \frac{\varphi(z)-z}{z}$ for any $z \in U(\bar{K})$.

THEOREM 5.1. The sequence (2) is exact.

Proof. We note firstly that $\text{Im } j \subseteq \ker(\varphi-1)$.

Let $\mathbb{Q}_p \subseteq k_1 \subseteq k_2 \subseteq \dots \subseteq k$ be a sequence of finite extensions of \mathbb{Q}_p such that $k = \bigcup_i k_i$. Let $K_i = (k_i)_{nr}$ for any i . Then:

$$(\mathbb{Q}_p)_{nr} \subseteq K_1 \subseteq K_2 \subseteq \dots \subseteq K \text{ and } K = \bigcup_i K_i$$

a) Let us prove that $\varphi-1$ is onto..

If $a \in U(\bar{K})$ then there exists $a_i \in U(K_i)$ for any $i \geq 1$ such that $a = \prod_{i=1}^{\infty} a_i$. Since the sequence:

$$1 \rightarrow U(k_i) \rightarrow U(\bar{K}_i) \xrightarrow{\varphi_i-1} U(\bar{K}_i) \rightarrow 1$$

is exact for any i ([3], § 4.2 Theorem 2), there exists $z_i \in U(\bar{K}_i)$ such that $\frac{\varphi(z_i)-z_i}{z_i} = a_i$.

Denoting by $\overline{\pi}_i$ an uniformising element of k_i (and thus also of K_i and \overline{K}_i) then since $\zeta_i \in \overline{k_i(V_\infty)}$ one has:

$$\zeta_i = \sum_{j=0}^{\infty} \alpha_{ij} \pi_i^j, \varphi(\zeta_i) = \sum_{j=0}^{\infty} \alpha_{ij}^q \pi_i^j, \alpha_{i0} \neq 0, \alpha_{ij} \in V_\infty \cup \{0\}.$$

Now, if $n_i \in \mathbb{N} \cup \{\infty\}$ is the exponent of $\overline{\pi}_i$ in $(a_i - 1)$ then $\varphi(\zeta_i) \equiv \zeta_i \pmod{\overline{\pi}_i^{n_i}}$ and we derive: $\alpha_{ij}^q = \alpha_{ij}$ and $\alpha_{ij} \in k_i$ for $j = 0, 1, \dots, n_i - 1$.

Hence $\rho_i = \alpha_{i0} + \alpha_{i1} \overline{\pi}_i + \dots + \alpha_{i, n_i-1} \overline{\pi}_i^{n_i-1} \in U(k_i) = \ker(\varphi_i - 1)$ and denoting $\eta_i = \rho_i^{-1} \zeta_i$ one has:

$$\eta_i \equiv 1 \pmod{\overline{\pi}_i^{n_i}} \text{ and } (\varphi - 1) \eta_i = (\varphi - 1) \zeta_i = a_i \text{ for any } i \geq 1.$$

Then the product $\prod_{i=1}^{\infty} \eta_i$ is convergent and $(\varphi - 1) \left(\prod_{i=1}^{\infty} \eta_i \right) = \prod_{i=1}^{\infty} a_i = a$.

b) Let us prove that $\ker(\varphi - 1) \subseteq \text{Im } j$.

If $x \in \ker(\varphi - 1) \subseteq U(\overline{K})$ then there exists $b_i \in U(K_i)$ such that:

$$x = \lim_{i \rightarrow \infty} b_i$$

$$\varphi(x) = x \text{ implies } \lim_{i \rightarrow \infty} \varphi(b_i) = \lim_{i \rightarrow \infty} b_i, \text{ hence } \lim_{i \rightarrow \infty} v(\varphi(b_i) - b_i) = \infty.$$

$$\text{Put, as above: } b_i = \sum_{j=0}^{\infty} \alpha_{ij} \pi_i^j, \alpha_{ij} \in V_\infty \cup \{0\}, \alpha_{i0} \neq 0.$$

$$\text{From } \varphi(b_i) - b_i = \sum_{j=0}^{\infty} (\alpha_{ij}^q - \alpha_{ij}) \pi_i^j.$$

We derive: $\alpha_{ij}^q = \alpha_{ij}$ and $\alpha_{ij} \in k_i$ for $j = 0, 1, \dots, t_i - 1$, where $t_i \in \mathbb{N} \cup \{\infty\}$ denote the exponent of $\overline{\pi}_i$ in $(\varphi(b_i) - b_i)$.

Then, if we put $c_i = \alpha_{i0} + \alpha_{i1} \overline{\pi}_i + \dots + \alpha_{i, t_i-1} \overline{\pi}_i^{t_i-1} \in k_i \subseteq k$, we have

$$v(b_i - c_i) \xrightarrow{i \rightarrow \infty} \infty \quad \text{hence } x = \lim_{i \rightarrow \infty} c_i \in U(\overline{k}).$$

6. The fundamental isomorphism

Let k as in §5 and suppose for the moment that $p \nmid [k : \mathbb{Q}_p]_{\infty}$.

Let E be a finite abelian extension of k , $K = k_{\text{nr}}$, $k_0 = K \cap E$ the maximal unramified extension of k in E and let $L = KE = E_{\text{nr}}$. Denote by φ_0 and ψ the Frobenius automorphisms of K/k_0 and L/E respectively. One has: $\psi_K = \varphi_0$ and $(\psi - 1)V(\bar{L}/\bar{K}) = V(\bar{L}/\bar{K})$. Then the homomorphism $\psi - 1: U(\bar{L}) \rightarrow U(\bar{L})$ from §5 induces the (onto) homomorphism, denoted also by $\psi - 1$:

$$\psi - 1: U(\bar{L})/V(\bar{L}/\bar{K}) \rightarrow U(\bar{L})/V(\bar{L}/\bar{K})$$

One has the diagram:

$$(3) \quad \begin{array}{ccccccc} & & & A & & B & \\ & & & \downarrow & & \downarrow & \\ 1 \longrightarrow & \text{Gal}(\bar{L}/\bar{K}) & \xrightarrow{i} & U(\bar{L})/V(\bar{L}/\bar{K}) & \xrightarrow{N_{\bar{L}/\bar{K}}} & U(\bar{K}) & \longrightarrow 1 \\ & \downarrow \gamma & & \downarrow \alpha & & \downarrow \beta & \\ & \text{Gal}(\bar{L}/\bar{K}) & \xrightarrow{i} & U(\bar{L})/V(\bar{L}/\bar{K}) & \xrightarrow{N_{\bar{L}/\bar{K}}} & U(\bar{K}) & \longrightarrow 1 \\ & \downarrow & & \downarrow & & & \\ & C & & D & & & \end{array}$$

where γ is the null homomorphism, $\alpha = \psi - 1$, $\beta = \varphi_0 - 1$, $A = \ker \alpha$, $B = \ker \beta$, $C = \text{coker } \gamma$, $D = \text{coker } \alpha$.

Also one sees that: $C = \text{Gal}(\bar{L}/\bar{K})$, $D = 1$, $B = U(\bar{K})$ and $A = U(\bar{E}) \cdot V(\bar{L}/\bar{K})/V(\bar{L}/\bar{K})$.

The diagram (3) is commutative and has exact rows and columns, hence

" $N_{\bar{L}/\bar{K}}$ " and " i " define the homomorphisms $A \xrightarrow{N_{\bar{L}/\bar{K}}} B$ and $C \xrightarrow{i} D$ and the "snake lemma" gives a homomorphism $\mathcal{J}: B \rightarrow C$ such that the sequence $A \xrightarrow{N_{\bar{L}/\bar{K}}} B \xrightarrow{\mathcal{J}} C \xrightarrow{i} D$ is exact.

We get then an induced isomorphism:

$$\mathcal{J} : U(\bar{k}_0)/N_{\bar{E}/\bar{k}_0}(U(\bar{E})) \longrightarrow \text{Gal}(\bar{L}/\bar{K}) \simeq \text{Gal}(\bar{E}/\bar{k}_0) \simeq \text{Gal}(\bar{E}/\bar{k})_{\text{ram}}$$

THEOREM 6.1. a) If $p \nmid [k : Q_p]_\infty$ and E is a finite abelian extension of k , then one has an isomorphism

$$\mathcal{J}_{E/k} : U(\bar{k})/N_{\bar{E}/\bar{k}}(U(\bar{E})) \longrightarrow \text{Gal}(\bar{E}/\bar{k})_{\text{ram}}$$

b) If $p \nmid [k : Q_p]_\infty$ and E is a finite abelian extension of k such that $p \nmid [\bar{E} : \bar{k}]$ then one has an isomorphism

$$\mathcal{J}_{E/k} : U(\bar{k})/N_{\bar{E}/\bar{k}}(U(\bar{E})) \longrightarrow \text{Gal}(\bar{E}/\bar{k})_{\text{ram}}$$

c) If $p \nmid [k : Q_p]_\infty$ and E is a finite abelian extension of k such that $[\bar{E} : \bar{k}] = p^t$ then

$$N_{\bar{E}/\bar{k}}(U(\bar{E})) = U(\bar{k})$$

For the proof we need the following result:

LEMMA 6.1. If k is as above and k' is a finite unramified extension of k then $N_{\bar{k}'/\bar{k}}(U(\bar{k}')) = U(\bar{k})$.

For a proof of Lemma 6.1 one may use Lemma 4 \hookrightarrow 3.3 of [3] and the technique used in this paper.

Now for a) let $K = k_{\text{nr}}$, $L = E_{\text{nr}}$, φ = the Frobenius automorphism of K/k , ψ = a prolongation of φ to L and $I = \{x \in E / \psi(x) = x\}$. Then $I_{\text{nr}} = I \cdot K = L$, $I \cap K = k$, I/k is totally ramified, E/I is unramified, \bar{I}/\bar{k} is totally ramified, \bar{E}/\bar{I} is unramified and one has:

$$N_{\bar{E}/\bar{I}}(U(\bar{E})) = U(\bar{I}) \text{ and } U(\bar{k})/N_{\bar{I}/\bar{k}}(U(\bar{I})) \simeq \text{Gal}(\bar{L}/\bar{K})$$

$$\text{But } N_{\bar{I}/\bar{k}}(U(\bar{I})) = N_{\bar{E}/\bar{k}}(U(\bar{E})) \text{ hence } U(\bar{k})/N_{\bar{E}/\bar{k}}(U(\bar{E})) \simeq \text{Gal}(\bar{L}/\bar{K})$$

which proves (a).

A proof of b) comes in a similar way, by reproducing Lemma 6.1, the diagram

(3) and all ζ_5 in the hypothesis stated in b).

As for c), let K and L be the maximal inertial extensions of k and E respectively, denote $k_0 = E \cap K$ and let ψ and φ_0 be the Frobenius automorphisms of L/E and K/k_0 respectively. Then one has the diagram:

$$\begin{array}{ccccc}
 & A & & B & \\
 & \downarrow & & \downarrow & \\
 1 \longrightarrow & U(\bar{L}) / \sqrt{V(\bar{L}/\bar{K})} & \xrightarrow{N_{\bar{L}/\bar{K}}} & U(\bar{K}) & \longrightarrow 1 \\
 & \downarrow \psi^{-1} & & \downarrow \varphi_0^{-1} & \\
 1 \longrightarrow & U(\bar{L}) / \sqrt{V(\bar{L}/\bar{K})} & \xrightarrow{N_{\bar{L}/\bar{K}}} & U(\bar{K}) & \longrightarrow 1 \\
 & \downarrow & & & \\
 & 1 & & &
 \end{array}$$

From Proposition 4.3 it follows that: $U(\bar{k}_0) = N_{\bar{E}/\bar{k}_0}(U(\bar{E}))$. Applying Lemma 6.1 which is also true in this case if k' is a finite inertial extension of k , we obtain $U(\bar{k}) = N_{\bar{E}/\bar{k}}(\bar{E})$. Q.E.D.

REMARK 6.1. The isomorphism $\sigma_{E/k}$ defined by Theorem 6.1 a) and b) will be called "fundamental isomorphism".

If k and E are as in Theorem 6.1 a) or b) and if $Q_p \subseteq k_1 \subseteq k_2 \subseteq \dots \subseteq k$ is a sequence of finite extensions of Q_p such that $\bigcup_{i \geq 1} k_i = k$, then there exists $n_0 \in \mathbb{N}$ such that $([\bar{K} : \bar{k}], [k_{i+1} : k_i]) = 1$ for any $i \geq n_0$. Let π be an uniformising element of E_{n_0} . If $u \in U(\bar{k})$ there exists $u_0 \in U(\bar{k}_0)$ with $N_{\bar{k}/\bar{k}_0}(u_0) = u$. Then there exists $\zeta \in U(\bar{L})$ with $N_{\bar{L}/\bar{K}}(\zeta) = u_0$ and there exists $\sigma \in \text{Gal}(\bar{L}/\bar{K})$ such that

$$\zeta^{\psi^{-1}} \equiv \pi^{\sigma^{-1}} \pmod{V(\bar{L}/\bar{K})}.$$

The isomorphism $\sigma_{E/k}$ is given by:

$$u \pmod{N_{\bar{E}/\bar{k}}(U(\bar{E}))} \longmapsto \sigma \in \text{Gal}(\bar{L}/\bar{K}) \simeq \text{Gal}(\bar{E}/\bar{k})_{\text{ram}}$$

The isomorphism $\sigma_{E/k}$ has an important property of functoriality.

Let k and E be as in Theorem 6.1 a) or b) and let $k \subseteq E' \subseteq E$.

Then $N_{\bar{E}/\bar{k}}(U(\bar{E})) \subseteq N_{\bar{E}'/\bar{k}}(U(\bar{E}'))$ and one has the diagram:

$$(5) \quad \begin{array}{ccc} U(\bar{k}) / N_{\bar{E}/\bar{k}}(U(\bar{E})) & \longrightarrow & Gal(\bar{E}/\bar{k})_{ram} \\ \downarrow & & \downarrow \\ U(\bar{k}) / N_{\bar{E}'/\bar{k}}(U(\bar{E}')) & \longrightarrow & Gal(\bar{E}'/\bar{k})_{ram} \end{array}$$

where the vertical homomorphisms are the canonic ones.

PROPOSITION 6.1. The diagram (5) is commutative.

For the proof, see [3], § 5.2, Lemma 3, and the above remark.

§ 7. THE SUBGROUPS OF NORMS

PROPOSITION 7.1. Let $Q_p \subseteq k \subseteq \Omega$ such that the residual field k_v of k is finite and $p \nmid [k : Q_p]_\infty$. Let $k \subseteq l$ be a finite abelian extension and let $\{k_i\}$, $\{l_i\}$ be sequences as in § 2. Denote: $H_i = N_{l_i/k_i}(U(l_i))$, $H = N_{l/k}(U(l))$ and $\tilde{H} = N_{\bar{l}/\bar{k}}(U(\bar{l}))$. Then:

- 1) $H_{i+1} = N_{k_{i+1}/k_i}^{-1}(H_i)$ for any $i \in \mathbb{N}^*$
- 2) $H_i \subseteq H_{i+1}$ for any $i \in \mathbb{N}^*$
- 3) $H = \bigcup_{i \geq i_0} H_i$ where $i_0 \in \mathbb{N}$ is such that $([k_i : k_{i_0}], [l : k]) = 1$ for any $i \geq i_0$
- 4) $\tilde{H} = \bar{H}$.

Proof. 1) follows from the equality $l_{i+1} = k_{i+1} \cdot l_i$.

2) is obvious.

3) follows from the equalities: $N_{l/k} \upharpoonright l_i = N_{l_i/k_i}$ for any $i \geq i_0$.

4) If $\bar{x} \in \widetilde{H}$ then $\bar{x} = N_{\bar{l}/\bar{k}}^{-1}(\bar{y})$, $\bar{y} \in U(\bar{l})$. Since $\bar{y} = \lim_{n \rightarrow \infty} y_n$, where $y_n \in U(l)$ one has $\bar{x} = N_{\bar{l}/\bar{k}}^{-1}(\lim_{n \rightarrow \infty} y_n) = \lim_{n \rightarrow \infty} N_{l/k}^{-1}(y_n)$, hence $\widetilde{H} \subseteq \bar{H}$.

In order to obtain the other inclusion it is enough to prove that \widetilde{H} is closed in $U(\bar{k})$. We shall show that \widetilde{H} is an open subgroup of $U(\bar{k})$, hence it is also a closed subgroup of $U(\bar{k})$. Let $\alpha \in H$ and choose $a \in U(\bar{l})$ such that $\alpha = N_{\bar{l}/\bar{k}}^{-1}(a)$. Denote by

$$f(x) = x^q + \alpha_1 x^{q-1} + \dots + \alpha_{q-1} x + \alpha_q$$

the minimal polynomial of a over \bar{k} . Then $\alpha = \alpha_q^m$ where $m = [\bar{l} : \bar{k}(a)]$. Let $\delta > 0$ and $\beta \in U(\bar{k})$ such that $v(\alpha - \beta) > \delta$.

Let $\beta_q \in \bar{\Omega}$ be a root of $F_{\beta_q}(x) = x^m - \beta$ for which $v(\alpha_q - \beta_q)$ is largest. If $\zeta \in \bar{\Omega}$ denotes a primitive root of 1 of order m , then:

$$v(\alpha_q - \beta_q) \geq \frac{1}{m} v\left(\prod_{i=0}^{m-1} (\alpha_q - \zeta^i \beta_q)\right) = \frac{1}{m} v(\alpha - \beta) > \frac{\delta}{m}$$

Hence for large δ one has: $v(\alpha_q - \beta_q) > \sup_{1 \leq i \leq m-1} v(1 - \zeta^i) \geq \sup_{\sigma \in \text{Gal}(\bar{\Omega}/\bar{k})} v(\alpha_q - \sigma(\alpha_q))$ and from Krasner's Lemma we derive: $\bar{k}(\beta_q) \subseteq \bar{k}(\alpha_q)$, i.e. $\beta_q \in \bar{k}$.

Now let $g(x) = x^q + \alpha_1 x^{q-1} + \dots + \alpha_{q-1} x + \alpha_q$ and denote by b_1, \dots, b_q the roots of $g(x)$ in $\bar{\Omega}$, arranged such that $v(a - b_1) \geq v(a - b_j)$ for $2 \leq j \leq q$.

Since $v(a - b_1) \geq \frac{1}{q} v((a - b_1) \dots (a - b_q)) = \frac{1}{q} v(g(a)) = \frac{1}{q} v(\beta_q - \alpha_q) \geq \frac{\delta}{q \cdot m}$, it follows from Krasner's Lemma that for large δ one has $\bar{k}(a) \subseteq \bar{k}(b_1)$, hence $g(x)$ is irreducible over \bar{k} , $\bar{k}(a) = \bar{k}(b_1)$, and $\widetilde{H} \ni N_{\bar{l}/\bar{k}}^{-1}(b_1) = \beta_q^m = \beta$. Thus \widetilde{H} is open in $U(\bar{k})$ and this completes the proof of (4).

Let $k, \{k_i\}$ be as in Proposition 6.1. Let $i_0 \in \mathbb{N}$ and H_{i_0} be a subgroup of $U(k_{i_0})$ such that: $\left| U(k_{i_0})/H_{i_0} \right|$ is relatively prime with $[k_i : k_{i_0}]$ for any $i \geq i_0$. Denote, for $i \geq i_0$: $H_i = N_{k_i/k_{i_0}}^{-1}(H_{i_0})$ and let $H = \bigcup_{i \geq i_0} H_i$.

Denote by $\mathcal{H}(k)$ the set of subgroup H of $U(k)$ which are obtained in this manner (by varying i_0 and H_{i_0}) and by $\mathcal{H}(\bar{k})$ the set of subgroups \bar{H} of $U(\bar{k})$ where H runs over $\mathcal{H}(k)$.

PROPOSITION 7.2. Let $Q_p \subseteq k \subseteq \Omega$ such that $p \nmid [k : Q_p]$ and k_v is finite. For any $H \in \mathcal{H}(k)$ there exists a finite totally ramified abelian extension l of k such that: $N_{l/k} U(l) = H$ and $N_{\bar{l}/\bar{k}}(U(\bar{l})) = \bar{H}$.

Proof. For any $i \geq i_0$ let l_i be a totally ramified finite abelian extension of k_i such that $H_i = N_{l_i/k_i}(U(l_i))$. One has $l_{i+1} = k_{i+1} l_i$ hence if $l_{i_0} = k_{i_0}(\alpha)$ then $l_i = k_i(\alpha)$ for any $i \geq i_0$. Now put $l = k(\alpha)$ and conclude the proof by applying Proposition 7.1.

THEOREM 7.1. Let $k, l, \{k_i\}, \{l_i\}$ be as in the Proposition 7.1. There exists an isomorphism $\varphi_{l/k}$ such that the following diagram (where Res is the restriction and φ is induced by the inclusion $U(k) \subseteq U(\bar{k})$) is commutative:

$$\begin{array}{ccc} U(\bar{k})/\bar{H} & \xrightarrow{\delta_{\bar{e}/\bar{k}}} & \text{Gal}(\bar{l}/\bar{k})_{\text{ram}} \\ \varphi \uparrow & & \uparrow \text{Res} \\ U(k)/H & \xrightarrow{\delta_{e/k}} & \text{Gal}(l/k)_{\text{ram}} \end{array}$$

Proof. We have to prove that φ is an isomorphism (then we put $\varphi_{l/k} = \text{Res} \circ \delta_{\bar{l}/\bar{k}} \circ \varphi$). Let $\bar{\alpha}_1, \bar{\alpha}_2, \dots, \bar{\alpha}_m \in U(\bar{k})$ be a system of representatives for $U(\bar{k})/\bar{H}$.

For any $n \in \mathbb{N}$ let $\alpha_1^{(n)}, \dots, \alpha_m^{(n)} \in H$ be such that $v(\bar{\alpha}_i - \alpha_i^{(n)}) \geq n$ for $i = 1, \dots, m$. We assert that for large n the images of $\alpha_1^{(n)}, \dots, \alpha_m^{(n)}$ in $U(k)/H$ are distinct. If not,

then there exists $i_0 \neq j_0$ and an increasing sequence $\{n_t\}_{t \in \mathbb{N}}$ such that $(\alpha_{i_0}^{(n_t)})/(\alpha_{j_0}^{(n_t)}) \in H$ for any t , and this implies $(\bar{\alpha}_{i_0})/(\bar{\alpha}_{j_0}) = \lim_{t \rightarrow \infty} ((\alpha_{i_0}^{(n_t)})/(\alpha_{j_0}^{(n_t)})) \in \bar{H}$, contrary to our assumption.

We have thus the inequality:

$$\left| U(k)/H \right| \geq \left| U(\bar{k})/\bar{H} \right|$$

If there exist $\beta_1, \dots, \beta_{m+1} \in U(k)$ which have distinct images in $U(k)/H$ then they also have distinct images in $U(k_i)/H_i$, where "i" is choosed large enough such that $\beta_1, \dots, \beta_{m+1} \in U(k_i)$. But $\left| U(k_i)/H_i \right| = [l_i : k_i]_{\text{ram}} = [\bar{l} : \bar{k}]_{\text{ram}} = \left| U(\bar{k})/\bar{H} \right|$. Therefore:

$$\left| U(k)/H \right| = \left| U(\bar{k})/\bar{H} \right|.$$

Now let $\alpha \in U(k) \cap \bar{H}$. Fix an $a \in U(\bar{l})$ for which $N_{\bar{l}/\bar{k}}(a) = \alpha$. Let $f(x) = x^q + \alpha_1 x^{q-1} + \dots + \alpha_q$ be the minimal polynomial of a over \bar{k} , Then $\alpha = \alpha_q^m$ where $m = [\bar{l} : \bar{k}(\alpha)]$. Let:

$$g(x) = x^q + \beta_1 x^{q-1} + \dots + \beta_{q-1} x + \alpha_q, \text{ where } \beta_i \in k, v(\beta_i - \alpha_i) > \delta.$$

If δ is large enough, then from Krasner's Lemma it follows that there exists a root b of $g(x)$ such that $\bar{k}(a) = \bar{k}(b)$. Moreover, $g(x)$ is irreducible over \bar{k} and $N_{\bar{l}/\bar{k}}(b) = \alpha_q^m = \alpha$. Since $g(x) \in k(x)$ it follows tht $b \in l$ and $a \in H$.

This proved φ is injective. Hence it is an isomorphism, as asserted.

THEOREM 7.2. Let $Q_p \subseteq k \subseteq \Omega$ such that $p \nmid [k : Q_p]_{\infty}$ and $|k_v| = q < \infty$. Let $q_1 = (q - 1, [k : Q_p]_{\infty})$ and $V_{q_1} =$ the group of roots of 1 of order q_1 from $U(k)$. Then:

$$\bigcap_{\substack{l \supseteq k \\ \text{ab}}} N_{l/k}(U(l)) = V_{q_1}.$$

Proof. Let $a \in V_{q_1}$ and let l be a finite abelian extension of k . Then

$$d_1 = \left| U(k)/N_{l/k}(U(l)) \right| = \left| \text{Gal}(l/k)_{\text{ram}} \right|$$

is prime with $[k : Q_p]_{\infty}$ hence is prime with q_1 . Since the order of $a \pmod{N_{l/k}(U(l))}$ is a

divisor of both d_1 and q_1 it follows that $a \in N_{l/k}(U(1))$. Thus:

$$V_{q_1} \subseteq \bigcap_{\substack{l \geq k \\ ab}} N_{l/k}(U(1))$$

Now let $a \in U(1)$, $a \notin V_{q_1}$. We have to prove the existence of a finite abelian extension l/k such that $a \notin N_{l/k}(U(1))$. Let $i \in \mathbb{N}$ such that:

$$1) (p \cdot \frac{q-1}{q_1}, [k_j : k_i]) = 1 \text{ for any } j > i.$$

$$2) a \in U(k_i).$$

Let $m \in \mathbb{N}$. Denote $U^m(k_i) = \{u \in k_i / u \equiv 1 \pmod{\pi_i^m}\}$ and $V^m(k_i) = U^m(k_i) \cdot V_{q_1}$. Since $|V^m(k_i)/U^m(k_i)| = q_1$ and $|U(k_i)/U^m(k_i)| = q^m(q-1)$, it follows that $|U(k_i)/V^m(k_i)| = \frac{q^m(q-1)}{q_1}$ is relatively prime to $[k_j : k_i]$ for any $j > i$.

Let $H_i^m = V^m(k_i)$, $H_j^m = N_{k_j/k_i}^{-1}(H_i^m)$ and $H^m = \bigcup_{j \geq i} H_j^m$. From Proposition 6.2 it follows that there exists a finite abelian extension l_m of k for which $N_{l_m/k}(U(l_m)) = H^m$.

Since $a \notin V_{q_1}$, there exists $m \in \mathbb{N}$ such that $a \notin V^m(k_i)$. Then one has for any $j \geq i$:

$$N_{k_j/k_i}(a) = a^{[k_j:k_i]} \notin H_i^m, \text{ hence } a \notin H_j^m.$$

Therefore $a \notin H^m$.

COROLLARY. Let $Q_p \subseteq k \subseteq \Omega$ such that $p \nmid [k : Q_p]_\infty$ and $|k_v| = q < \infty$

Then $\bigcap_{\substack{l \geq k \\ ab}} N_{l/k}(U(1)) = 1$ if and only if $q-1$ and $[k : Q_p]_\infty$ are relatively prime.

THEOREM 7.3. The hypothesis and notations being as in Theorem 6.2, let k_{ab} be the maximal abelian extension of k . Then one has:

$$\text{Gal}(k_{ab}/k)_{\text{ram}} \cong U(k)/V_{q_1}.$$

Proof. For any finite abelian extension l of k one has the isomorphism:

$$U(k)/N_{l/k}(U(l)) \xrightarrow{\delta_{l/k}} \text{Gal}(l/k)_{\text{ram}}$$

and if $k \subseteq l \subseteq l'$, such that l'/k is finite and abelian, the diagram

$$\begin{array}{ccc} U(k)/N_{l'/k}(U(l')) & \xrightarrow{\delta_{l'/k}} & \text{Gal}(l'/k)_{\text{ram}} \\ \downarrow & & \downarrow \\ U(k)/N_{l/k}(U(l)) & \xrightarrow{\delta_{l/k}} & \text{Gal}(l/k)_{\text{ram}} \end{array}$$

is commutative. Then there exists a canonic isomorphism

$$\delta_k: \varprojlim U(k)/N_{l/k}(U(l)) \longrightarrow \varprojlim \text{Gal}(l/k)_{\text{ram}}$$

But

$$\varprojlim U(k)/N_{l/k}(U(l)) \simeq U(k)/\bigcap_l N_{l/k}(U(l)) = U(k)/V_{q_1}$$

and

$$\varprojlim \text{Gal}(l/k)_{\text{ram}} \simeq \text{Gal}(k_{\text{ab}}/k_{\text{nr}}) \simeq \text{Gal}(k_{\text{ab}}/k)_{\text{ram}}.$$

Q.E.D.

We conclude this paper with the following result which comes naturally from what was already proved.

THEOREM 7.4. Let $Q_p \subseteq k \subseteq \bar{\Omega}$ such that the residual field of k is finite and $p \nmid [k:Q_p]_{\infty}$. Then there exists a canonical one-to-one correspondence between $\mathcal{H}(k)$ and the set of finite abelian extensions of k_{nr} , and a canonical one-to-one correspondence between $\mathcal{H}(\bar{k})$ and the set of complete finite abelian extensions of \bar{k}_{nr} .
